

By default, PowerToys Run can be opened using the key combination: Alt + Shift. When you click this combination, a small search bar will appear on your screen. Here, you can type in your query, and you will be presented with matching results from your computer, and if not, an option to search the keyword on the default browser.

Inside the settings menu of PowerToys Run, you can

WINDOWS KEY SHORTCUT GUIDE

While many may know about the popular features of PowerToys and what they do, a select few know that a tool as utility-focused as PowerToys has a built-in guide that will help you get through the various list of actions that you can perform using a key combination of the windows key. When used in conjunction with the Fancyzones feature,

+ Shift + /. But this can be changed to any combination that you would want to in the Shortcut Guides section of the PowerTools settings menu. There itself, you will also find the option to blacklist the apps that you don't want the shortcut menu to draw over and open when they are in focus. For doing that, type in the exe file name of the app(s) that you want to exclude, and you will be set.

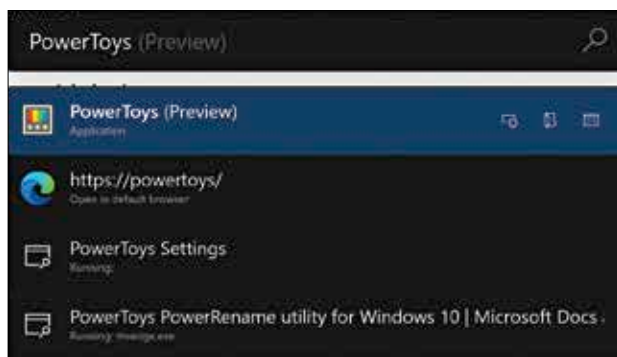

KEYBOARD MANAGER

All the macro and shortcut monarchs of the world have, for the most part, have had to use third party solutions on Windows to map different keys on their keyboards to different functions. But with the Keyboard Manager in PowerTools, Microsoft has managed to answer all their demands by providing a more integrated solution to map keys to different functions in Windows.

To use this, again, you will have to head over into the PowerTools settings menu, where you will find a tab listed as Keyboard Manager. When in there, you will find two different buttons,

"Remap a key" and "Remap a shortcut". They are quite similar. But the difference lies in the fact that one allows you to create one key macros for certain functions, while the other allows you to map a shortcut key combination to a key, which can be mapped in a certain application of your choice.

When using the remap a key option, you will be able to assign simple action or key combinations to a single key. For example, if you want to assign the key shortcut of copy to an available button on your mouse, you can do that here. Just click on the '+' icon, and a new set of options would appear. Here, the button labelled with type will allow you to input in your own key combination or a specific key. You can also select the key you want to use from a drop-down located right below. The options that are listed on the left side of the bar will be for the key you want to use, and on the right will be the key/key combination you want to map. Once done, click the ok button located in the top part of the window. When you are in the remap a shortcut option, you will

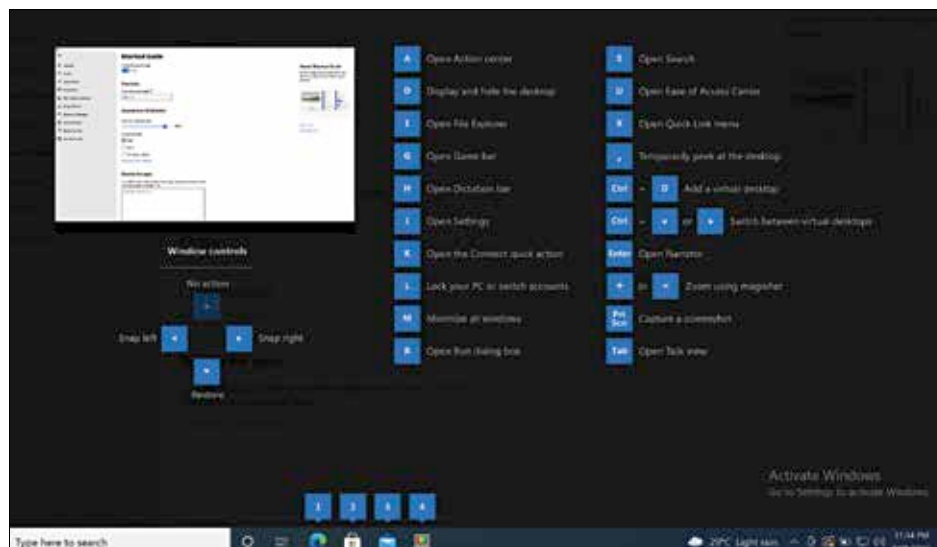

It is like Spotlight for Windows

alter the number of results that appear and even the position and appearance of the search bar, meaning the place where it appears. You can configure the search bar to either appear on the screen that the cursor is placed on, the one with a focused window on it, or the primary screen only. One setting that is disabled by default, and we would recommend all the Visual Studio users to turn on, is the one that would allow Visual Studio Code workspaces to be included in the search results. To turn it on, inside the PowerToys Run settings menu, scroll all the way down to the option under the plugins section, labelled Visual Studio Code Workspaces. If it is not on by default, which it most probably would be, just toggle it on, and you would be good to go.

this feature can be of the ultimate use of the geeks and utility-focused users, who do not want a single second of their time wasted in moving the mouse around and those things that the normal users do.

The default key combination to trigger this is Win
