

The REAPER workspace

There are many useful plugins that come along in REAPER

Track; and you will see a new track added to your workspace. Now you can start making music and recording it on REAPER. To begin the process, you have to make the device live first. Hit the bright red colored button, which will arm your input source, so that you can start recording. Once that is done, and you are ready with your input device, say a mic or a guitar or DJ pad, locate a similar red button on the bottom half of your screen and click that. It will start your recording. You can also hit cmd+R to start your recording. To stop the recording, you will need to press the stop button or the space bar on your computer.

You can also add digital filters or effects using the VST plugins to your incoming MIDI signal. To do that, head over to your recording track, and locate the 'FX' button there. Click that, and the mouse over to the plugin of your choice from the list that is available there. Once selected, hit the Add button the bottom right corner of your window and now, your input signal will be routed through the Virtual Studio Technology or VST plugin that you have added.

REAPER can also be used to edit and mix prerecorded audio files. For doing that, add a new track, and drag

and drop in the audio that you want to edit into the track workspace of your choice. With that done, you can go around, cutting, looping or changing other parameters of your audio track, just like you would do in any editing software. For example, you can split the audio track into bits by moving your cursor to the desired point and hitting the shortcut key, S or by right clicking or as Apple calls it, control click on the audio track at the point and select the 'Split items at cursor' option. Note that

prerecorded audio tracks are also available to be added effects to, and this can be done using the same method as for tracks using MIDI input.

EXPORTING THE TRACK

After you have added VST plugins, recorded the guitar riff that would put the best guitarist on planet to shame, and topped it with a sweet, prerecorded backing track, it is time to show off your musical genius to the world. To do that, move to the File tab on the top menu bar. There, in the bottom part of the drop-down, you will find the 'Render' option. Click that, and you will be greeted with a window that has all the custom options for you to change, like naming the track, deciding where it will be stored and setting things like the channel parameters of the final track. With that done, now you can see if the track will be properly rendered using the 'Dry Run (no output)' option in the bottom right part of the window. Once the check is done, click the 'Render' option, right to it and you will have your next internet breaking audio track at your disposal. **d**
