PRINT MEDIA

People will never stop reading newspapers, here is why

Satvik Pandey | feedback@digit.in

N

ewspapers and periodicals have been two of the most popular forms of print media in the

history of human civilisation. They have gone through various changes, faced their challenges but have stood firm to maintain an identity of their own. Starting a weekend with a fresh issue of your favourite magazine or a Monday morning with a cup of tea and newspaper is a feeling that nothing can ever replace. However, it was not always like this.

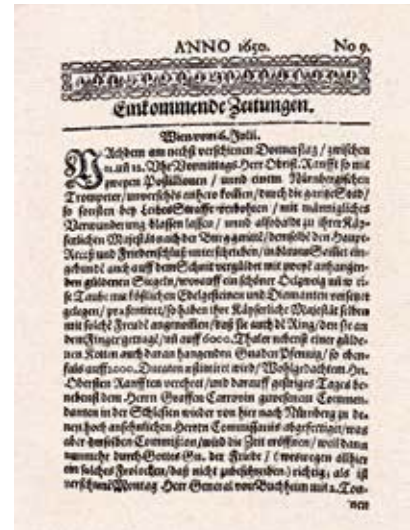

The modern history of any print media, be it magazines, newspapers or books, is credited to the invention of the Gutenberg press, which revolutionised the world of printing. It was not the first time that paper with words on it, which mainly were informative and centred around the current affairs of the society, was being created. One of the first newspapers, as commonly credited to, was published by the Romans, called *Acta Diurna*, or daily doings, in 59 BCE. Buddhists monks in China developed movable type in the form of curved wooden blocks, on which ink was painted and subsequently pressed against paper. The earliest surviving book produced using this method is "The Diamond Sutra", which is dated to 868. The method spread to Korea and Japan as well. The Gutenberg Press was developed almost 600 years later, in the year 1440 and started a phase in the his-

tory of humankind, where information was more accessible than ever before. However, it wasn't until the 17th century that the newspapers started using the technology. Around 1609, *Relations: Aller Furnemmen*, printed by Johann Carolus, and *Aviso Relations over Zeitung*, published by Lucas Schulte, emerged, which used the printing press. At the time, censorship by the ruling class was so strictly imposed that the names of the cities that they were published from remained a mystery. The only hints that can be derived about the location of their printing come from the language, which was German.

Publications cropped up and vanished over the next few years all across Europe. In 1621, the first paper in England was published, called "Corante: or, Newes from Italy, Germany, Hungarie, Spaine and France". Over the next two decades, the newspaper publishing industry all over the Europe picked up traction, and almost every country had a newspaper in circulation by the year 1641. One common thing that remained across most of these publications was the government's censorship and attempts to control what was being written and

published in the papers. In 1644, John Milton's newspaper, *Areopagitica*, expressed their thoughts against the heavy government regulation of the medium. Other publications took note and joined Milton's newspaper in criticising the censorship, paving the way for one of the first freedom of press movements. In 1650, the oldest surviving daily newspaper of the world, the *Einkommende Zeitung*, began published in Germany.

The shift in the power dynamics in England led to the *Daily Courant* and other papers being shut down by 1735, and a lot of changes came along in terms of the freedom of the press in the truest sense. In the 18th century, another big revolution hit the world of newspapers, where the papers went from being 4-page publications to 8-page publications, which included information on a wide array of topics.

After that, there was no looking back for newspapers. The production of newspapers took off all over the world, and they became an effective tool for dissent and even fuelled
