

Feds for Tesla Autopilot

765,000 cars including the Tesla Model Y, 3, S and X are under investigation right now. <https://digit.in/sep21-03>

Bezos sues NASA

Blue Origin is suing Nasa over a decision to award a \$2.9bn lunar lander contract to SpaceX. <https://digit.in/sep21-04>

GERTY 3000

Moon

2009

We can never really understand why megacorporations keep sending out lonely astronauts on solitary missions into space, but at least they are kind enough to include AI companions such as GERTY. In this movie, the robot relates increasingly to the crew member Sam Bell, who unearths some bizarre things that his bosses had been hiding from him. This story shows a positive relationship between man and machine, as the robot goes above and beyond their programming to help their mortal companion, and gets a healthy dose of humanity in the process.

TARS

Interstellar

2014

TARS is a US military tactical robot, looks like the monolith from 2001 and is a versatile swiss knife of a robot, able to quickly morph into various configurations as required by the use case. They could move very quickly over tricky terrain, or jump into a cockpit and seat designed for humans, and delicately fly a ship.

TARS is by no means a mindless drone though, and has all the quirks of the personality programmed in, that is required to communicate like a human to other crew members over long and intense missions.

L3-37

Solo

2018

L3 hacks her way into self awareness, comes to care deeply about droid rights, and frees a supervillain base full of robots from a lifetime of servitude! She is literally a self made droid in the sense that she herself picks and chooses the parts that goes into giving her upgrades, and has a close relationship with Lando. L3 ends up paying a heavy price for believing in her cause as much as any of the other heroes in the series, but get's an unlikely afterlife becoming one with the most famous ship in the galaxy, at least one with a nerf herder for a pilot.

Bubs

Space Sweepers

2021

Okay let's just try to get this all into one sentence. Bubs is a robot undergoing gender confirmation and has a propensity of getting a limb amputated. Talk about representation. She was also an ex child soldier who is now working with the dredges of society, salvaging the junk in Earth orbit to make a living. She is also a kickass fighter who jumps between drones and spaceships with a deftly wielded telescoping space harpoon, and easily holds her own in a cast full of compelling human characters. This robot can easily pass the DARPA challenges.
