

Zephyr Pro

Marsback has come up with a “sweat-proof” gaming mouse, dubbed the Zephyr Pro. This is an upgrade to their existing mouse, the Zephyr, which had a fan built into it. The goal of course being to keep your hands cool while you gamed. While the Zephyr wasn’t all that impressive, both as a gaming mouse and as a cooling mouse, the Zephyr Pro supposedly is a much better improvement. Especially in the fan department which now reportedly actually keeps

your palms cool and “sweat-proof” while gaming. In addition to actually working, the noise made by the fan has also been significantly reduced, as well as the vibration. It’s certainly not silent, but it’s not bothersome either. According to creators Marsback, less noise

doesn’t mean less cooling power, and tests show that the cooling is actually better on the Pro. One of the reasons for this could be the fact that the fan now points directly upwards, instead of at a 45 degree angle. Other than that, as a gaming mouse, the Zephyr Pro features on-board memory and software to rebind buttons and customise the RGB lighting. However, there’s no way to adjust fan speed, it’s just on or off.

IKEA Starkvind

For a while now, IKEA has taken to disguising its smart home gadgets to make them appear like other pieces of furniture. The latest product from the Swedish company is an air purifier, disguised as a small coffee table.

When we think of air purifiers we usually imagine something that looks like a mini cooler or AC, that aesthetically speaking, never really fits in a room. IKEA’s idea of disguising the air purifier as an end table is a brilliant one to that end. Add to that the fact that the Starkvind is a smart air purifier that works with IKEA’s accompanying app, and you’ve got a winner. The app allows manual control for the purifier’s fan speeds, or allows you to set it to auto mode where it will turn on automatically when it detects particulates in the air.

According to IKEA, the three-filter system in the Starkvind will capture everything, from larger particles like hair to the small stuff you’d need a microscope to see.

There’s also a standalone version of the Starkvind that doesn’t look like a coffee table and retails for less. Both versions are expected to go on sale starting October.

Mini Simpsons TV

Brandon Withrow, who goes by the name ‘buba447’ on Reddit, has used a 3D printer and a Raspberry Pi to create a tiny replica of the Simpsons’ living room TV. Oh wait, did we mention that it actually works?

Withrow is working on an in-depth guide to help others build their own mini TVs, however, a lot of the basics have already been laid down on Reddit. The TV was designed and modeled using Autodesk Fusion 360, and an Ender 3 Pro 3D printer was used to create all of the plastic parts used by the TV.

Withrow uses a 640x480 TFT display, with a 4:3 screen ratio, and he

has put the first 11 seasons of The Simpsons on the Raspberry Pi Zero’s 32GB microSD storage, which is hidden away inside the mini TV. The Simpsons wasn’t created in HD or widescreen format until season 20, so the 4:3 ratio is just perfect. All episodes were compressed to fit within the screen, and the episodes play at random on the TV. The TV is powered via a USB connector, and even the knobs on the TV actually work. The knob on top of the TV powers it on and off, and the rotating dial is a volume control. The TV continues episodes where you left off when powered back on, as long as it was powered off the right way.
