

Face Following Fan

AchillesVM has built a face-following table top electric fan, which can track him as he moves around the room. The fan's pan and tilt controls are provided by a pair of servo motors, which are controlled by a Raspberry Pi 3b+. It has a Raspberry Pi v2 Camera, which uses OpenCV's default face-tracking algorithm to track where AchillesVM or the nearest user is. When the camera picks up multiple faces, it automatically follows the largest face,

which in most cases will be the face closest to the fan.

The entire tracking and follow process takes around 60ms, so the servo mechanism has trouble keeping up with faster moving faces. The fan itself was built from the ground up by user AchillesVM on GitHub, and is a project he describes as "both incredibly dangerous and horrendously impractical!" He also explains that this is exactly why he made it. The fan uses 3D-printed parts, including the entire case, and parts off-the-shelf, such as the RC plane propeller shown here. The project is still a work in progress, but you can certainly follow AchillesVM on GitHub to keep up with the updates.

GingerOfOz Portable PS2

GingerOfOz, who has the same username on Twitter and YT, is someone who is no stranger to portable conversions. So this portable PS2 from him doesn't really come as a surprise. The quality of the device also shouldn't come as a surprise, considering the portable PS2 looks like something Sony themselves might have made.

The portable PS2 can play just about any PS2 game titles from its USB memory. However, there are still a few exceptions, such as certain games that will not start unless you have a Dualshock controller plugged in. In terms of performance, the portable PS2 suffers from no FPS issues, and achieves authentic framerates. The portable PS2 uses a PS2 slim motherboard, which he's cut down using a dremel. GingerOfOz uses custom PCBs for the rest of the hardware, which include the volume controls and the battery charging.

Arcade1Up Jr.

Arcade1Up have come out with a new line of arcade machines to introduce the new generation to the joys of retro arcade gaming. The Arcade1Up Jr. line has two machines out so far, with one centered around Pac-Man, and the other around the PAW Patrol franchise. The Pac-Man arcade machine features three arcade classics, including Pac-Man, Galaga and Dig Dug. The PAW Patrol machine also features three games, the franchise trilogy – Chase is in a Race, PAW Patrol Off Duty and PAW Patrol Pups on the Go!

The Arcade1Up Jr. cabinets are aimed at kids, between the ages of 4-8, and are just three feet tall. The machines also feature oversized buttons to make it easier for kids to use and learn the ropes. Additionally, the Arcade1Up Jr. machines come with extra features to help kids beat the games, such as unlimited lives, and the ability to slow down the action on the screen.

Each machine features an 8-inch monitor, and they're ready to play right out of the box. The Arcade1Up Jr. machines are expected to go on sale this October, starting with the Pac-Man machine, and the PAW Patrol machine will go on sale in November.
