

Seagate One Touch with Password 5TB

Portable storage devices used to be a very drab segment and they only picked up after SSDs entered the market. Since then storage manufacturers have been waiting for the next fastest interface to become ubiquitous before releasing faster SSDs. We now have portable SSDs with USB 3.2 Gen 2x2 standards that can give speeds of 20 Gbps. However, hard drives haven't had much luck.

Hardware manufacturers have been trying to experiment with different external designs to appeal to a wider demographic but given how the internals are still the same, there really isn't much that can be done. So portable hard drives now come with freebies, and that too plenty of them. Some of these freebies include cloud storage subscriptions, media editing suite subscriptions, and

even security software add-ons. The Seagate One Touch with Password portable HDD is one such device.

The One Touch HDD has a very contemporary look with its brushed metal finish. The indicator LED is in one corner and is very discrete. The box comes with a USB 3.0 micro to

USB Type-A cable so those with only Type-C interfaces can give this one a miss. The good part is when you connect the drive, you get access to the Seagate Toolkit software which offers AES-256 hardware encryption. Being a hardware encrypted device has its pros and cons. The pro is that the encryption is hard to defeat so your data is safe. The con is that the encryption is hard to defeat, so if you've forgotten the key and don't have access to the backup key, then you're done for.

Transfer speeds are decent, you get an average of about 105 MBps on USB Type 3.1 ports, so it's very much like an internal hard drive. There's no intermediary SSD which could act as a cache so you'd want to use this one for archiving data and not for quick transfers of large files.

Ambrane Stylo Pro

Ambrane has released a series of power banks in India under the 'Stylo' name, which feature type-C inputs and come in three variants.

These include the Stylo Pro, the Stylo 20K and the Stylo 10K. The 20K and 10K are self-explanatory, signifying the capacity of those variants at 20,000mAh and 10,000mAh respectively. The Stylo Pro stands out with its massive 27,000mAh capacity. All three variants come with quick charge 3.0 for fast charging.

The Stylo Pro is quite heavy, which makes sense because of its massive capacity. All three of the stylo power banks are built pretty sturdily, and feature a rubber-like texture on most of the body which provides grip. The side of the powerbank with all the ports uses glossy plastic. The entire powerbank is a fingerprint magnet however, and if you've got naturally oily hands, it's going to show on the powerbank body.

We received the Stylo Pro for review, which supposedly features up to 20W fast charging, and supports multiple device charging thanks to its 2 USB

outputs. It has a Type-C in and out to both charge itself and charge other devices when not being charged. Upon receiving the device we were able to use it to charge our devices, and we did indeed see that they were being fast charged. However, within a few weeks of using it, the powerbank stopped working. Attempting to charge the powerbank would show the lights turning on, but even after leaving it to charge overnight, it refused to

charge anything or even turn its lights on unless it was being charged. We couldn't find the device on Amazon at all, however it is available on Flipkart for ₹2,999 (currently out of stock). Checking reviews for the device we came across more people for whom the powerbank stopped working soon after receiving it. Another thing we noticed was that the images posted by reviewers weren't actually of the power bank in question but a different model, which is pretty odd; it looks like reviews have been pulled from another Ambrane powerbank.
