Web-borne threats in India doubled in Q2 2021

Internet-based threats in India doubled in Q2 of 2021 as compared to the first quarter, according to Kaspersky. Kaspersky detected and blocked approximately 8.3 crore Internet-borne cyberthreats during the period between April-July 2021. In comparison, 3.76 crore web-borne threats were reported by Kaspersky between January-March 2021. This places India in 37th place worldwide when comes to internet-based cyberthreats. When comparing the threats detected in Q2 of 2020 with Q2 of 2021, an 8 fold increase was observed overall. These kinds of attacks usually take place when visiting an infected website, without any intervention from the user and usually, without their knowledge. Among these attacks, file-less malware and social engineering attacks are considered the most dangerous. On the positive side though, the KSN report noted a significant decrease in the number of local threats detected in India in Q2 of 2021.

MOBILE WATCH

Samsung Galaxy S22 Ultra

The Samsung Galaxy S22 Ultra is expected to launch next year and here is the first look. The leaked renders show off the design that harks back to the Note 20. Digit has partnered with renowned tipster OnLeaks to bring you the first look of the S22 Ultra. The phone has flat edges on the top and bottom along with a slot that houses the S Pen. The S22 Ultra features a 6.8-inch curved display that is likely to be a high-resolution AMOLED panel with a high refresh rate. The dimensions provided by OnLeaks suggests that the S22 Ultra measures roughly 163.2 x 77.9 x 8.9mm and is 10.5mm thick if you include the camera bump. It is also expected that Samsung will showcase gains in camera performance with a quad-camera setup.

APP WATCH

Camo

The rise of remote work has led to the boosted sales of webcams since the pandemic began. However, webcams, even exorbitant ones, aren't as good as modern-day smartphone cameras. Enter Camo, an app that turns your smartphone into a portable webcam for your laptop or PC. The app was already available on iOS and has now made its way to Android as well but in public beta (Early Access). The app is

simple to operate – it uses your phone's rear camera as a makeshift webcam for live conferencing. Camo claims to deliver high-quality video with low latency at up to 1080p resolution. To use the app, you need to pair it up with the PC client Camo Studio. This is available for macOS and Windows. The desktop software acts as a control hub and allows users to perform actions such as adjusting brightness, focus, adding filters, and much more. You can do all of this straight from the PC app without tweaking things around on your phone.

The app not only lets users utilise the main rear camera but also the ultra-wide, telephoto and selfie camera. If you're in a group setting, using the ultra-wide camera may be the way to go. Camo is compatible with all mainstream apps such as Zoom, Google Meet, Skype, and

others. A perk for Android users currently is that while the app is in beta (early access), it is free to use. There is a Pro version on iOS that unlocks all features and removes the watermarks. It costs \$40 annually.

MelonDS

MelonDS is a free, open-source Nintendo DS emulator for mobile devices. It features a customisable software controller, Bluetooth controller support, and more. It is in early access beta at the time of writing.

OnMail

OnMail is an email client that focuses on security and privacy. It features built-in anti-tracking, email filtering, and more. It works best with OnMail, but you can use almost every feature on Gmail, Yahoo and Outlook accounts too.

Opera Football

If you're a football fan, this is a great app for you. The app can be used to see real-time results for football matches, glance at league tables, breaking news, notifications and stats in the world of football.
