

Slow Xbox production

Phil Spencer says supply chain constraints will continue to slow Xbox production into 2022. <https://dgit.in/oct21-47>

\$38B spent on apps

Across Apple's App Store and the Google Play Store, a new report says that customers spent \$33.6B. <https://dgit.in/oct21-48>

with what you should be getting from your ISP but that's not how you go about figuring these things out. Ensuring airtime fairness requires that you leave plenty of headroom for each client to get as many data packets out and in if there's a sudden need for more bandwidth. You can have 120 clients on a 100 Mbps connection and you can have 120 clients on a 1 Gbps connection, in both cases you have enough bandwidth to browse the internet but the moment you have a couple of users jumping onto a video call, you'll see a stark difference in user experience for everyone.

Coming back to our original problem of handling 120 clients. We can add a few caveats to make life simpler. Not all devices will need full bandwidth at all times and not everyone will be present in the office at all times. Using this logic, you can easily cut your bandwidth estimates down to 4000-5000 Mbps.

You can either cater to this requirement by using a couple of Wi-Fi 5 or Wi-Fi 6 home routers in which case, you are going to congest the space with a lot of Wi-Fi signals that would easily cause a toss-up or you can get a few highly capable devices. Also, home routers often have software limitations on the number of clients it can handle simultaneously whereas enterprise or business routers with nearly the same hardware can handle a lot more. It simply makes sense to go for an enterprise or business solution for such requirements.

We settled down on two SKUs which are apt for our needs.

1. ASUS XT8 (2 Node) - ₹48K
2. Netgear Orbi Pro SXK80 (2 Node) - ₹70K

Both of these are mesh routers with each node capable of handling more than 60-70 clients simultaneously and they also have the option of using a wired backhaul. The backhaul is how different nodes within a

mesh network talk to each other. This is an important aspect as you get to free up a Wi-Fi band and use that for servicing clients instead of wasting it on inter-node communication.

Moreover, being enterprise solutions, these devices also feature smarter controls that allow you to manage your network infrastructure better instead of letting a bunch of preset algorithms figure out everything on the fly. Not that there's anything wrong with letting the devices manage everything on their own but if you have a few bandwidth hoarders in your office, then these control mechanisms will let you deal with them fairly.

All of this is applicable for a single-floor office setup. If you have more than one floor, then you're looking at adding additional nodes on each floor. This might seem like a slightly expensive solution but when you're dealing with so many devices, you need to bring out the big guns. [d](#)

BUYING ADVICE

Q Hello Agent001, I needed to know some of the best gaming mouse to buy under the budget 3-4K. I play Minecraft bedwars and I need at least 3 side buttons on the left side and a button to switch my mouse sensitivity. And it should have high tracking precision. My budget is 3K. Also, it should be able to drag click or atleast butterfly click. Lastly RGB is not much of a priority but if possible then please include it. Thanks in advance

P.S. - I want this mouse for my birthday.

-Naman

A Hey Naman, Butterfly-clicking, drag clicking and jitter clicking are all different methods of achieving higher clicks

per second. The actual mouse doesn't have much to do with it. You could have a narrow left-click panel and still be able to butterfly-click if you have slender fingers. You simply have to get comfortable with the mouse and practise enough to develop that

Logitech G402 Hyperion Fury

muscle memory. The difficult aspect is to get a mouse with three buttons on the side that are easily reachable and grouped together. Take the Logitech G402 Hyperion Fury as an example. It has five buttons that are accessible to your index finger aside from the left click. Two for varying DPI, two that are mapped to forward and backward

in web-browsers and one button for momentary DPI reduction for better aim. All of these buttons can be mapped to whichever keys or macros you want using Logitech's software. However, the DPI switches are a little far from the other three buttons, so if

you want all buttons to be grouped together then that's going to be a task. Similarly, the G502 Hero has a very similar button arrangement.

The G402 is the only mouse in your budget with that many buttons on the side which are close to each other. Everything else, such as the Razer Naga Trinity, cost a lot more. The precision of the G402's sensor is top notch and it even has a little bit of lighting. It's not a full-blown in-your-face type of RGB but it's something. [d](#)
