extensions out-of-process. This helps with ensuring that Visual Studio doesn't crash if anything goes wrong with the extension. If you're getting the latest Preview 4 release of Visual Studio 2022, then you can check all of these new features out today.

Oracle changes licensing for JDK 17

Oracle is changing the licensing model for the Oracle JDK starting with release 17. Oracle has introduced a new license termed the Oracle No-Fee Terms and Conditions" (NFTC) license which makes

the Oracle JDK free to use for all users and even allows commercial and production use. Users may even redistribute the JDK as long as it is kept free. Updates will now be provided for each release up until

one year after the next LTS release. Why has Oracle come out with a new license while it releases OpenJDK under the GPL is something that only Oracle can answer but at least

this way, we're heading towards a more open development experience. Oracle Java SE subscription will continue to be offered by the company at the same existing fee schedule.

GitHub defends against vague infringement allegations

The SAS Institute, Inc. v. World Programming Ltd. case is what GitHub is referring to. The company submitted a "friend of the court" brief in the case because of one key reason. SAS Institute has filed copyright and non-copyright claims against World Programming because the latter's software follows a structure and organisation that is similar to what SAS has. Essentially, there is no specific instance of copyright infringement at all, this is more of a "kinda, sorta, feels like" infringement. The claim is very vague and is non-literal so there's no actual copyright violation. GitHub, one of the world's biggest repositories for code, has a lot to be worried about if such a lawsuit swings in favour of the vague allegations made by the claimant. If one repository on GitHub were to fall prey to a similar lawsuit, then all dependent projects would simply be rendered non-functional overnight as they'd all be subject to the same penalties. Hence, filing as a non-party to the conflict, GitHub simply voiced its opinion towards keeping the developer ecosystem safe from vague claims of copyright infringement.

Docker Desktop goes paid for corporates

Docker recently changed their subscription model for the Docker Desktop app. The app, which was free for all until now, will be paid for folks who are part of companies that have more than 250 employees or if the annual revenue is more than USD 10 million. Depending on the company's employee strength or their revenue, users will have to pay USD 5, 7 or 21 per user, per month. For a company that rakes in more than USD 10 million, this might seem like loose change but the developer community has reacted to this change of terms in quite a ferocious manner. Twitter went

nuts with folks screaming blue murder over what they're terming as a "bait and switch" move by Docker. Enterprise clients will mostly have no problems with this change of terms and will quickly pony up the fees. However, individual users who are in no way affected

by the change (since Docker Desktop continues to be free for them) are ironically the loudest among the protestors. Docker's competitors are loving all the attention they've suddenly started getting in light of all the "alternatives to Docker" articles cropping up on every major developer portal. 📌
