Microsoft set with surface pro 8

New Surface Pro 8 will ship with the biggest hardware design & spec changes since the Surface Pro 3. <https://digit.in/oct21-2>

Teardown: Samsung Galaxy Watch4 and Watch4 Classic

Mostly good news for repairs

Dhriti Datta | dhriti@digit.in

Some more silicone

While the back of the Watch4 Classic motherboard doesn't hold any more silicone wonders, the Watch4 has some more chips in view. You get to see the S915 intermediate frequency IC and the Broadcom BCM43013 ultra low power dual-band 802.11n Wi-Fi and Bluetooth 5.0 combo IC. The watches are pretty similar silicone-wise as shown via the spec sheets.

Prying open the watches isn't too hard

Both the Galaxy Watch4 and Watch4 Classic open up from the back where four tri-point screws hold the body together. A simple nudge from an opening tool reveals the innards. There's no heat or slicing needed, which is always good news. A rubber gasket provides the IP68 rating and you get to remove a few parts quite early on, namely the flex cables and the wire that measures your body composition.

Setting your eyes on the motherboards

You can see the Watch4 Classic's motherboard on the left and the Watch4's MoBo on the right. The motherboards hold the Exynos W920 dual-core 1.18 GHz processor along with 1.5GB of LPDDR4 RAM. You also get the Samsung Shannon 915 intermediate frequency IC, the Broadcom BCM43013 ultra low power dual-band 802.11n Wi-Fi and Bluetooth 5.0 combo IC, and what looks like a Qualcomm power amplifier.
