

London's Cab going full electric

Addison Lee has pledged to convert its whole passenger car fleet to electric vehicles by 2023. <https://dgit.in/oct21-3>

FB CTO to step down

Mike Schroepfer will be replaced by Andrew Bosworth, the head of Facebook's hardware division. <https://dgit.in/oct21-4>

Power 'em up!

No, not actually powering them on, but we're talking about the batteries that power these watches. The batteries on both watches can be removed without any heat whatsoever. The Watch4 Classic houses a 1.40 Wh battery while the 40mm Watch4 has a 0.95 Wh cell. The 2021 Mi Watch packs more power with 1.62 Wh.

Samsung Galaxy Watch4 and Watch4 Classic

Some interesting components

The last few components also come free from the midframe relatively easily. There's a vibration motor next to the barometric sensor and an interesting button flex cable. This cable carries a microphone for snore tracking and an additional contact plate opposite its connector. This plate allows the watch to close an electrical circuit that runs through your body to analyse bioelectric impedance for body composition tracking.

Different screen removal experiences

Most Galaxy watches are known for their screen repair friendly nature and the Galaxy Watch4 Classic is a good example of that. It requires little heat and a gentle push to separate the AMOLED screen from the frame. Unfortunately, the standard Watch4 complicates matters in this aspect. It required much more heating and even some slicing tools but the display still cracked under the pressure.
