

Anycubic Photon Ultra 3D Printer

Funding: US\$ 2,049,737 pledged of US\$ 99,905 goal

Link: <https://dgit.in/anycubic>

Shenzhen-based printer manufacturer, Anycubic, launched a 3D printer with DLP (Digital Light Processing) tech dubbed the Photon Ultra. DLP printing is an additive manufacturing technology where a digital light projector is the light source. This light source combines with a Digital Micromirror Device (DMD) to cure the photopolymer resin to make objects from images come to life. It is faster compared to SLA 3D printers, reaching printing speeds up to 1.5 sec per layer. Featuring a print volume of 102.4 mm (L), 57.6 mm (W), and 165 mm (H) the Photon Ultra is capable of printing at 720p. Being a DLP printer has perks such as low-to-no maintenance, high-res prints and low-power consumption. The printer also

comes with a colour-LCD touchscreen that adjusts settings directly on the printer. The printer has a laser-engraved build platform to give models something to grip, providing better adhesion for higher printing success. Operating at "40% light efficiency", Anycubic claims it has an average power consumption of 8.5 W, therefore producing less heat and noise. The printer is being crowd-funded on Kickstarter and pledgers can get it for \$499.

ChillFeed

Funding: US\$ 227,476 pledged of US\$ 10,000 goal

Link: <https://dgit.in/chillfeed>

ChillFeed is a portable air-conditioner that was launched on Kickstarter. It can not only cool your surroundings but can also be used as an emergency power bank, light and 20 W Bluetooth speaker making it a 4-in-1 product. The device has a rugged design and can be used indoors as well as outdoors with confidence, as per the company. The air conditioner is compact and it offers two working modes – fan and cooling. The device comes with two USB-A ports and one USB Type-C port for fast charging multiple devices on the go. It has a 360-degree rotating emergency LED light as well. The device generates 1100 BTU/H which is capable of cooling an area of up to 55 square feet. The unit has a 20 Ah removable lithium battery that can support up to 6 hours of use at maximum output. There's also a battery display that allows users to check the battery levels at a glance. Users can also charge the device one of four ways. Via the ChillFeed battery, a wall outlet, a car outlet, or a solar panel. ChillFeed comes with a detachable exhaust hose that evacuates hot air and draws in fresh cold air. Additionally, ChillFeed is also pretty quiet and has a minimum noise level of 43 dB. The device is available for \$219 for backers which is a significant drop from its MSRP of \$499.

Carvera

Funding: US\$ 425,733 pledged of US\$ 100,000 goal

Link: <https://dgit.in/carvera>

Carvera is a fully automated desktop CNC machine that has recently launched via Kickstarter. The startup Makera behind this product wanted to create a smart, easy-to-use desktop CNC machine that can be used by novices and professionals alike. Carvera comes with some interesting features such as auto tool changing and auto probing. Whether you are levelling, cutting, cleaning, drilling or carving, Carvera can automatically switch to the right tool for the job without any intervention.

The machine also comes with a built-in dust collection system which is normally not present on desktop CNC machines due to size and space limitations. However, Makera found a way to integrate a

dust collection system inside the machine that automatically collects dust whenever required. It also comes equipped with an integrated 2.5 W diode laser module that lets you engrave patterns or words onto your product. The laser module can engrave materials such as paper, wood, plastic, fabric, PCB, leather, and more. You also get an optional fourth axis module to help you create cylindrical items, double-sided objects and even 3D shapes. Carvera also features a control software that is supported across operating systems including Windows, Mac, iOS, and Linux. You can remotely operate and monitor the machine which is an improvement over traditional CNC machines that had to be connected to a computer via a USB cable.
