Galactic Fireworks

Who knew stellar nurseries were so pretty

Aditya Madanapalle | aditya@digit.in

NGC 1300

Distance: 61 million light years

Constellation: Eridanus

This is a typical "grand design" galaxy which has an inner spiral within the galactic spiral. The spiral structure measures about 3,300 light years across. This galaxy does not have an active nucleus, which indicates that the central black hole is not feeding on matter.

These are images captured by the MUSE instrument on board European Souther Observatory's Very Large Telescope. The false colour images have a golden glow for the presence of hydrogen, oxygen and sulfur gas, indicating star formation, with the older stellar material represented in shades of blue.

NGC 1087

Distance: 80 million light years

Constellation: Cetus

This one is a little bit of an oddball. Although technically a barred galaxy, the bar is so short that it does not look like a barred galaxy at all. The nucleus of the galaxy is also tiny compared to other galaxies of similar size. There are spiral structures that are dust lanes, not clumps of stars.
