Beautiful equations in mathematics

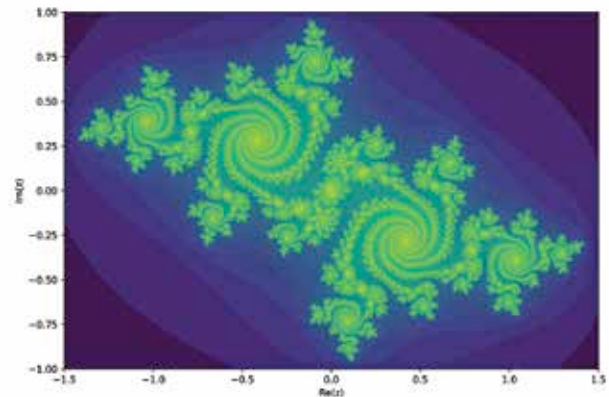

Textbooks tend to make everything so boring, and maths is one of the most obscure, unintelligible subjects there is, because of its inherent abstractness. These plots here are just a few chosen windows into the strange universe of mathematics, and many of them impact our daily lives in complex ways we do not yet fully understand.

Jaykrishna Gadhavi | feedback@digit.in

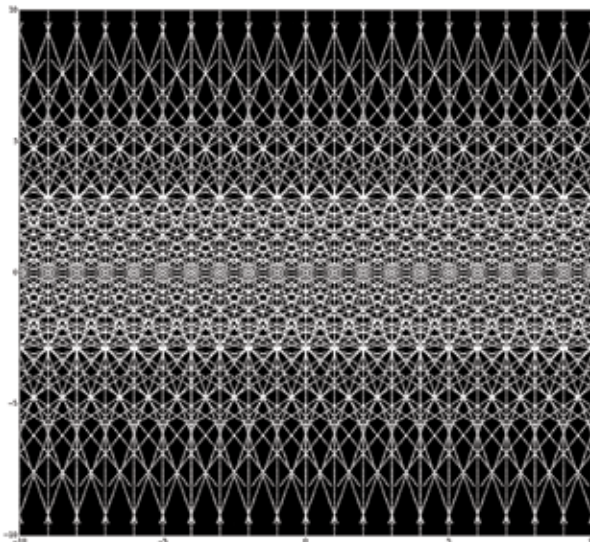

The prime spiral

The prime spiral, also known as Ulam's spiral, as this construction was first presented by Stanislaw Ulam, is a plot in which the positive integers are arranged in a spiral. Here, the the primes indicated in red along the spiral.

Julia Set

When a fractal like the Mandelbrot function is continually repeated a certain number of times, it creates two sets of results, one which falls under the finite plane, second falls under the complex number plane or Riemann sphere (complex number plane + the one infinite point). The border between the points of these two results in Julia set.

Euler's Identity

Given by Leonhard Euler and a direct result of Euler's Formula, this equation is considered to be the most beautiful equation in mathematics. The mathematical beauty of it is that the three fundamental arithmetic operations occur exactly once with the five fundamental mathematical constants.

Lorenz System

When talking about beautiful equations, we cannot miss out on the Lorenz system. It is a study of ordinary differential equations that have chaotic results in different parameters and values. The saying, "Beauty lies in chaos" stands true here, the chaotic values when plotted, end up looking like a butterfly.
