linguistics or a degree programme in linguistics with a computational linguistics specialisation. For doctorate candidates, some colleges offer certificate programmes in this field.

Experience

Many companies prefer candidates who have at least three years of relevant experience. Companies that build software, particularly translation tools or GPS devices, may have opportunities for work in computational linguistics. Speech pathology, search engines, data retrieval methods, and voice-to-text technology are all areas where computational linguists work. Computer programmer, data analyst, and software developer are some common job titles in the industry that can assist linguists build a strong foundation.

SCOPE OF COMPUTATIONAL LINGUISTICS IN INDIA

Indic languages have been ignored for a long time in the domain of computational linguistics but over the past couple of years there has been a lot of

progress. There is a lot of scope for not only translating Latin languages to Indic languages but also from one Indian language to another.

Anusaaraka is an English-to-Hindi and Indic-to-Indic translation software that is based on algorithms derived from grammar rules

devised by 4th Century Sanskrit Philologist and Grammarian, Pāṇini.

Anusaaraka System

The load between the human reader and the machine in anusaaraka systems is divided as follows: the machine performs language-based text analysis, while the reader performs knowledge-based text analysis or interpretation. The output is generated by the machine using a dictionary and grammatical rules. Most notably, it does not interpret (or disambiguate) using world information, as this is an error-prone process that entails guessing or inferring from knowledge other than the text. The goal of Anusaaraka is flawless "information preservation." The requirement that the output be grammatically correct is relaxed. In reality, the grammar of the source language is followed by anusaaraka output (where the grammar rules differ, and cannot be applied with 100 percent confidence).

This necessitates the reader receiving some basic training in order to

read and comprehend the output. The task (and the training) is easier among Indian languages, which share vocabulary, syntax, pragmatics, and other features. For example, there is a single corresponding Hindi word for 80 percent of the Kannada words in the anusaaraka lexicon of 30,000 root words, which includes the senses of the original Kannada word. Similarly, where the two languages' grammatical constructs diverge, either an existing construction in the target language that communicates the same meaning is employed, or a new construction is constructed.

Mantra System

The Applied AI Group at C-DAC Pune constructed two parsers utilising the Augmented Transition Network (ATN) and Tree Adjoining Grammar (TAG) formalisms. The Applied AI Group took an early initiative in 1989 and began research in the domain of Machine Translation, examining possibilities in Natural Language Processing.

VYAKARTA, a Tree Adjoining Grammar [TAG]-based language parser that can handle Indian languages like Hindi, Sanskrit, Bangla, Marathi, Gujarati, Oriya, Punjabi, Urdu, Tamil, and Telugu, as well as foreign languages like English, Spanish, French, Chinese, Japanese, Arabic, and others, has been scouted for real-world applications.

The original work on MANTRA Technology won the prestigious ComputerWorld Smithsonian Award and is now part of the National Museum of American History's 1999 Innovation Collection in Washington, D.C.

ASUS

TUF Gaming H1

FREEDOM, COMFORT, IMMERSIVE AUDIO

Virtual 7.1 surround sound supported by Windows Sonic

Certified unidirectional microphone for clear in-game communication

Support PCs, Macs, PlayStation® 5, Nintendo Switch™, Xbox, tablets and mobile phones

www.asus.in | Toll Free No. 1800-2090-365
