

Rebrand is due for Facebook

Facebook is reportedly getting a new name and logo in the Annual Connect Conference. <https://digit.in/nov21-55>

Spotify sells Merch!

Spotify will be partnering up with Shopify which will allow artists to sell their merch directly. <https://digit.in/nov21-57>

IBM brings out the Open Source Cloud Guide

IBM has been championing open source for a while now and to show they mean business, they just came out with a guide to help developers hone their skills with open source initiatives. Called the 'Open Source Cloud Guide', the initiative is aimed at providing developers with a comprehensive learning solution to develop hybrid and multicloud applications. It also claims to provide an agnostic view of how various

clouds are built on the backs of open source projects. The guide will introduce developers to the basic concepts of cloud use cases, information on how clouds leverage open source solutions and also direct developers to additional sources

of information to learn more about the same. In each use case, the guide states how the use case would have been tackled in a traditional manner, how developers can tackle it using open source technologies, and how many of the cloud services are exactly doing it using open source alternatives. Think of it like a migration guide to help developers move away from proprietary technologies to open source alternatives. The guide is not complete at the moment, and like in true open source fashion, IBM is looking for folks to contribute to make the guide better.

need to ensure that you have the latest AWS CLI installed or you can also use any of the AWS SDKs.

Visual Studio course for writing VS Code Extension and Themes

If you're writing code, then you've most certainly checked out VS Code

or migrated to the IDE altogether. Its popularity has shot through the roof and for good reason. It is one of the most lean and feature rich IDEs out there right now. However, it's relatively new and that means that there aren't a lot of themes and extensions available for VS Code at the moment. Microsoft wants to change that and make it easier for developers to build extensions. So it's coming out with a series of video tutorials to help developers to set up with the right tools and extensions, and also

help them build custom extensions. Visual Studio 2022 will come with a new Theme Converter tool that will allow users to port VS Code themes to Visual Studio 2022. The team behind the update has already released a collection of community themes created using the new tool.

Docker gets support for IPv6 in Beta

The folks over at Docker are proud of the fact that the Docker Hub Registry will become one of the few container registries with support for IPv6 after the October 2021 update. Support for IPv6 has been on Docker's roadmap for quite some time and it's finally getting implemented. However, not everyone is going to benefit from this change as only the folks who are currently on or are migrating

to an IPv6-only network can use the Docker Hub Registry without having to implement a NAT64 gateway. IPv4 only users need not panic, support for IPv6 will not go away for a really long time but if you've already started the migration process or are currently running a dual stack setup with IPv4 being used in some places and IPv6 in other places, then you get to pick between IPv4 and IPv6 endpoints. At the moment, the IPv6 endpoint is only supported on the Docker Hub Registry when used with the Docker command line interface. Docker Desktop is still not supported.
