

Norway to hit 100% EV Sales

Analysis shows the last new petrol or diesel car sold in Norway will come as early as April, 2022. <https://digit.in/nov21-64>

Tesla recalls 3000 cars

Tesla recalls nearly 3,000 Model 3 and Model Y vehicles over separating suspensions. <https://digit.in/nov21-65>

big an impact a certain component, other than the CPU and GPU, might have on the overall performance. That has remained the same for decades. However, of late, we've seen the console manufacturers and software companies come out with direct interfacing methods with storage media. The latest consoles literally have that baked into the hardware and are waiting for a software update to take advantage of faster storage media.

So storage media are soon going to impact gaming performance by a small amount in the coming years. Please note, this is not just load times that we're talking here. On the 12th Gen Intel processors, there are certain games such as World of Tanks, Borderlands 3, Far Cry 5, etc which seem to get about 5-15 extra FPS when paired with DDR5 memory. There is a noticeable improvement in performance in some games, but for the

vast majority of games out there, the difference is barely 1-3 FPS.

So if you're looking to upgrade to the new 12th Gen processors, DDR5 isn't that big of a priority considering that only applications where multithreading was exhaustively used saw a decent uplift in performance. Most single-threaded workloads saw minimal improvements. Which is why, I won't advise folks to opt for DDR5 setups any time soon. [1](#)

BUYING ADVICE

Q Hi, I am looking for buying advice for television, here are my requirements:

- Size and resolution - 50" 4K TV
- Preference - balance between value and quality (low confidence in quality of China-made TVs and would like to avoid high priced premium brands)
- Existing devices - 5.1 Philips Sound System and Fire TV Stick 4K
- TV usage - Mostly on OTT apps to watch Hollywood movies and some Indian soaps by family. Less interest toward sports/news and gaming consoles.
- Country of origin - Any preferred other than China, not mandatory. My budget is around 35-38K and I've shortlisted some models:
 - Redmi 2021 LED @ 29k
 - AmazonBasics LED @ 32k
 - Mi 5X LED @ 37.5k
 - Philips PUT8215 LED @ 41k
 - TCL C715 QLED @ 41k

I am going to extend my budget and go ahead with TCL, do you think that's a wise decision for a 7-10 year life?

Thanks.

—Darshan

let's run through some models that can suit your needs and are in different price buckets. If there is a specific model you are looking for in a price we don't cover here, then do let me know and we'll try and find an option best suited for you.

TCL C715 QLED

Let's start with one of my favourite TVs for OTT consumption - The Philips 50-inch PUT8215. This is a good TV overall for OTT content consumption and has some of the easiest picture settings we've used to date. Overall, for the price, a good TV. The 50-inch is available at about 44K right now, and you may get it cheaper offline. You can check out our review here: <https://digit.in/philre>

Next up is the Sony 49X8000H: While we haven't reviewed the TV, we have seen it in action and its overall performance is very good. For your needs.

In our opinion, you should consider the Sony first and the Philips second.

However, if the price of the Sony TV is high, then the Philips is a good option.

A 7-10 year life will be a stretch. TCL TVs have issues with the UI, but since you are using a Fire TV Stick, it shouldn't be an issue for you. I say you will be happy for about 5-7 years based on usage before you feel like you need an upgrade. Also, after-sales service is something you will have to check. While we review the TVs for their overall performance, we don't have a way to judge the after sales a brand offers. So, you may want to investigate that.

Based on your preferences, this is my order.

- Philips PUT8215 (I think this TV can produce some wonderful colours)
- TCL C715 (you can check our review of the TV. While we did like the overall performance, the UI left us wanting more)
- Amazon Basics (mostly for the UI. But remember, the AmazonBasics TV does not support HDMI ARC which is a big con in my opinion)
- Mi TV 5X
- Redmi TV (the performance of Mi and Redmi are decent for the price. The Mi TV is slightly better and has a better design than the Redmi, but the Redmi is quite decent as well). [1](#)

Hey Darshan, Since your use case is clear,
