IKEv2/IPSec is used for rapid recon-
nections, as well as high speeds, so this
is useful for users finding themselves
switching from mobile hotspots to
Wi-Fi hotspots frequently, with the
connection to the proxy servers being
established quicker. There are some
older and less secure protocols, such
as PPTP, and it is better off if the
service providers do not support these
protocols as inexperienced users may
end up believing that their connections
are adequately protected when they
are not. Although in our tests, we have
simply scored providers for supporting
more protocols, it is actually a point in
favour of the VPN if they do not sup-
port outdated protocols.

Then of course, there are the
important considerations of pricing,
RAM usage and speed tests. Here we
found that the connection speeds vary
widely depending on the servers used.
For example, while some servers of
the same service performed well on
streaming and torrenting tests, others
did not. The speed tests are just a
general indicator of the difference in
speeds as compared to when not using
the VPN service, and there is always a
slight drop. In essence, the speed tests
have to be taken with a grain of salt.
With that being said, here are the best
VPN offerings for Indian users.

PrivateVPN

SCORE:
4.71

RANK:
10

PrivateVPN is the
lowest scoring
service in our tests,
with a small network
of servers, no
browser extensions,
and a low score in privacy. The last

reason is because PrivateVPN does not
offer a warrant canary or a transpar-
ency report, does not support split
tunneling, does not provide static IP
addresses, and is based in Sweden,
which is part of the Fourteen Eyes
alliance. This should not be strictly
speaking considered inherently as a
negative, because the no logs policy of
the service protects the users by
making the service unable to comply
with certain requests by government
agencies. Additionally, Sweden has
very stringent privacy laws. However,
compared to other services that are not
based in one of the Eyes countries,
PrivateVPN does lose just one point.
Note that the kill switch offered by the
service is available only in the Win-
dows client, and not available in the
others. PrivateVPN is a minimalist
client with a focus on ease of use. This
is one of the most user-friendly and
simple to use VPN services that we
have seen, with a clean UI that does not
overwhelm or confuse the user, but
providing all the granular control
options at the same time. Note that
logging in to the service
can be problematic at
times, with the Windows
Client getting an “API”
error at the time of
authentication. One of the
positives is the stealth
VPN setting, which is
handy for working
around services that
actively identify and block
users connecting to the
service using a VPN.
When it comes to speed,
RAM use and pricing,

PrivateVPN is somewhere in the
middle of the list. PrivateVPN is the
only service on our shortlist to not offer
a Linux app. When it comes to the
number of simultaneous connections,
PrivateVPN offers fewer than other
competing services, restricted to six
connections per account. While
PrivateVPN allows users to purchase
accounts through relatively fewer
payment systems, it is the only one on
the list to support Apple Pay on its
website. Other services can be pur-
chased on an iPhone, with the creden-
tials subsequently used to log in on a
PC. There are no caps on the band-
width, and PrivateVPN performs
adequately on the speedtests, doing
very well when it comes to streaming,
but slowing down considerably when it
comes to torrenting. Despite that,
overall, PrivateVPN is the third best
among all the VPN services compared
when it comes to speed. When it comes
to RAM usage, PrivateVPN is one of
the most resource hungry apps. One of
the strong points is its customer
support, which is available through the
