Note: Higher scores are better

app and through email 24x7. The staff is incredibly helpful, and even uses TeamViewer for troubleshooting or helping users get familiar with the service. Even though it comes at the bottom of the list, for casual users, PrivateVPN is a rock solid and reliable service that is suitable for streaming movies or torrenting.

StrongVPN

Right off the bat, one of the things working in StrongVPN's favour is that it offers the app in Hindi. However, this

does not work very well, as many of the terms such as connect and VPN are just transliterated into Hindi instead of translated. The Windows app is very minimal, it provides users with all the required advanced settings, and has you up and running in no time.

StrongVPN launched its VPN service way back in 2005, but started off as a PC components vendor in 1994, transitioning to becoming an internet service provider, and then a VPN service. StrongVPN is based in the USA, which is part of the Five Eyes, Nine Eyes and Fourteen Eyes alliance, which means that it is possible for law enforcement agencies to force StrongVPN to hand over data of users. However, the users are protected by StrongVPN's no logging policy. Additionally it scores low on privacy for neither providing a warrant canary nor a transparency report. There is a kill switch included, but no facility for getting a dedicated IP address. Note that StrongVPN used to offer dedicated IP addresses in the

past, and those with old accounts can still use the dedicated IP addresses, but when upgrading to a newer plan, these users will also lose their dedicated IP lines. While StrongVPN supports split tunneling, it does so only on the Android app. As this can be a major disappointment for users who want to use split tunneling on the PC, we did not give StrongVPN a point for supporting split tunneling only on Android, and as such the service gets no points for privacy. StrongVPN supports twelve simultaneous connections, which is the highest cap among all the providers we tested. The ones that offer more from our shortlist are Surfshark and IP Vanish, both offering unlimited connections. Based on user demand, the simultaneous connections have been increased to 12 from the previous 5. With 950 servers in 35 countries, StrongVPN has a relatively small network, and far fewer countries than other competing services. The next lowest after StrongVPN is PrivateVPN,

which has servers in 63 countries, and ranks at the bottom of our VPN list. While StrongVPN is available on all major operating systems, there is a browser extension only for Chrome. It is simultaneously one of the higher priced services, and one that offers fewer payment methods for purchase. You can only avail the service with a credit card or PayPal, and that is it. When it comes to the plans, they are very simple to understand, you either have a monthly subscription or a yearly

subscription. The user does not have to choose between too many tiers, and the yearly plan has a one month money back guarantee. The RAM usage is the lowest among all the services that we compared, and does not slow down the machine by much. While streaming videos is fast, StrongVPN suffers when it comes to torrenting speeds. One of the standout features of StrongVPN is that apart from the 24x7 support on chat and email StrongVPN is one of the few service providers to provide support over phone numbers as well.

VyprVPN

Though VyprVPN does not end up on the bottom of the list because of the way the services are scored, we would

highly recommend avoiding this service if you are a PC user. This is because there are serious problems with using the client on Windows 10,

and we were unable to even install it because of dependency issues. The tests for this particular service were conducted on a mobile device, as against a computer used for all the other services. For RAM usage, we just ended up giving the lowest score to VyprVPN.

VyprVPN is based in Switzerland, which is a politically neutral country, not part of any of the Eyes alliances, and has strong privacy laws. However, VyprVPN has its origins in the USA,

with its parent company, Golden Frog being setup as a response to the infamous Room 641a, a dedicated NSA surveillance facility for AT&T networks. VyprVPN, however, neither has a warrant canary nor publishes a transparency report. It does have a kill switch and supports split tunneling, but does not allow users to get their own dedicated IP address. VyprVPN does offer a business tier subscription, with a dedicated account manager, as well as a static IP address. However,
