

even this plan restricts the number of simultaneous connections to five users per account, which is not very practical for businesses. However, compared to the pricing of other VPN services, even the business tier is affordable to non business users, and can be a viable work around for getting a static IP address while using VyprVPN. Note that the split tunneling is supported only on Mac and Android devices, but not the Windows client. With 700 servers in 70 countries, the VyprVPN network is smaller than the other

Where VyprVPN scores high though, is the pricing. It is the cheapest among all the services that we short-listed. However, the pricing tiers are different from almost everyone else in the industry. VyprVPN offers a two month subscription, an eighteen month subscription and a thirty six month subscription, with a 30 day money back guarantee that serves as a trial. 36 months is a long term commitment, but VyprVPN provides the service at ₹135 per month, which works out to the lowest among all the services

services. While there are apps for all the major operating systems, VyprVPN only offers a Chrome plugin.

VyprVPN has developed its own protocol known as Chameleon, which is built to prevent deep packet inspection cannot detect OpenVPN packet metadata, which is scrambled. The protocol allows internet access in countries with restrictive regimes, as well as bandwidth throttling when VPN services are being used. The Chameleon protocol is built on top of the OpenVPN protocol.

that we compared. On pricing alone, VyprVPN wins. VyprVPN does not support any cryptocurrency payments, and users can only use a credit card or PayPal to avail the service, so compared to the others the payment options are also limited. When it comes to speedtests, VyprVPN was one of the lowest performers in our shortlist. Both streaming videos and downloading torrents are problematic and not very fast. Also note that a lot of the servers appear to be blacklisted by Netflix, so using the service to stream is not entirely hassle free, and it takes a bit of trial and error to connect to a server that supports streaming. When it comes to simultaneous connections, VyprVPN is also lacking, supporting only 5 devices at a time.

IPVanish

SCORE:
5.69
RANK:
7

IPVanish was founded in 2012 in Florida, USA, which is part of the Five Eyes, Nine Eyes and Fourteen Eyes

alliances. IPVanish was at the center of a privacy controversy, and is an example of what can go wrong when a VPN service is based in a country which is part of one of the Eyes alliances. In 2016, IPVanish handed over personal information of a customer that had time stamps of when the user connected to the VPN service as well as their real IP address. This information was provided despite a strict no logs policy. However, a VPN Service in one of the Eyes countries can be forced to monitor and log the activities of a particular user. The incident was covered by Torrentfreak and drummed up a controversy on Reddit, where privacy minded users pointed out that if IPVanish really enforced its own no logs policy, it would not have been able to comply with the request made by the government agency. While the person in question was a suspected criminal, and most regular users will never have a similar problem, or end up getting exposed in a similar way, it does go to show that a VPN service with a claimed no logs policy is not a foolproof method of using the internet anonymously.

IPVanish does not have a war-rant canary and does not publish transparency reports. While it does
