Windows 11: Is it worth the upgrade?

Our take on whether you should upgrade to Windows 11

Sushant Talwar | feedback@digit.in

A

fter a long wait, Windows users have finally gotten the much-awaited Windows 11 update.

With the new operating system, Microsoft has introduced some major changes to the way users experience Windows-based computers.

Interestingly, Microsoft is also sharing this new operating system for free with anyone who has a copy of Windows 10, so it is now giving its users very little reason to not embrace this new OS. However, before you upgrade, it will be important to remember that Windows 11 is still an operating system in the early stages of its life cycle and as such may throw up some bugs here and there – something that we expect to be fixed in the coming weeks and months. We've spent some time with Windows 11 in the past few days, testing not only the performance vis-a-vis Windows 10 but also taking look at all the new features.

WHAT'S NEW?

With Windows 11, Microsoft has brought in a number of changes that promise to change just how you interact with your Windows-based machines. From the inclusion of improved multi-window multitasking to features that improve PC gaming, there's a lot to be excited about here.

Arguably the biggest change that's come to Windows 11 is the fact that it comes with a new, simplified Start menu. This new Start menu comes with an updated Start button that is now positioned at the centre of the taskbar. This is a design change makes navigating the OS much easier.

This new Start Menu is built using Microsoft's Fluent Design language which features rounded corners and big icons. The search bar in the Start Menu is now displayed across the top, which depending on how you use your operating system could be an interesting addition.

Apart from this, Windows 11 also offers what Microsoft calls the Desktops feature that gives the user the ability to set up and manage multiple iterations of your desktop. It's a simple and easy feature to use. This can be accessed by going to this new icon that all Windows users of the past will

instantly notice on their home screens. This Task View button sits alongside the Start button and looks like contrasting windows over one another. Hover your pointer over it, and you'll see a small preview of all the desktops you have open, as well as the option to set up a new one.

These desktops can be given a different name, however, since the feature is more cosmetic in nature than anything, you see the different desktops access the same files on your PC. But in our time using the operating system, this feature didn't exactly work as we had expected. While you can set different wallpapers for each desktop, we realised that folders and shortcuts to apps remained shared between desktops. Interestingly, it does not duplicate apps and windows on all desktops.

The other big change to Windows 11 is that it comes with widgets. With this feature, Microsoft now offers tiles that
