to quickly preview how your effect would look in the Facebook Camera.

Once you're happy with your finished effect, you can publish or export your effect to share with others. For this, click the Publish button in the lower right corner of your app to export your effect and initiate the Spark AR Hub publication process. You will be greeted with a summary of the file size, as well as the options to Publish a new effect or Update an existing effect after you select the 'Publish' option:

Before exporting, it's a good idea to experiment with different compression settings for textures, to keep the size of your effect as small as possible and thus incrementing performance. Once you are done exporting your effect you can submit your file to the Spark AR Hub, to be published and shared to your social media handles. Note: it will be first reviewed by the Spark AR team to make sure it meets Spark AR Policies.

Now that we are somewhat familiar with the basics, let's try to create our very first yet simple effect. To begin with, open Spark AR studio (if you haven't yet), and head over to the "Create New" Tab on the left menu. You can now see a bunch of presets to play around with and explore, each designed with an unique use-case in mind.

For now, we will use the “Blank Project” button to create (as you guessed) a blank new project. It should open up a new window similar to the ones you saw above. Here is where all the magic of your effects are designed. You can head over to the top and select the back view option under the dropdown menu from the ‘view’ option.

Now let us start with importing some visual elements to our camera, which in this case is a rectangle. Head over to the scene elements panel on the left side and click on the tiny “Add Object +” button right below it. Now a search bar kind
