

Activision fires QA staff

Raven Software developers walk off the job to protest QA layoffs. <https://digit.in/dec21-36>

Apple undermines 3rd party repair

Leaked Apple videos show how the company trains technicians to undermine 3rd party repairs. <https://digit.in/dec21-37>

of small window will appear before you. Search for a plane in the search box or scroll down the menu to find it. Click on it and select the insert option and it should appear inside your scene panel as 'plane0'.

You can rename it or use it as it is to place some objects on top of it, which in our case is the Digit logo. As of now, you can notice how our plane is just this cross-checked plane instead, so first we have to pump in some life in it. Head over to the parameters panel on the right and click on the "+" button under the materials section to create our first material (which will serve as the base of the plane).

This will create a default 'material0' for the plane (better than that checkerboard plane eh?). You can quickly head over to the assets panel on the lower right to rename this material to 'Logo'. As you can see, it's still just a plain shade and not a very desirable one. So we click on this material and again head to the parameters panel and select 'choose file' to navigate and import our logo into this material.

Click Open to import it into the material and boom! We now have our very own geeky logo on the screen. You can also use the different manipulators to change the position, scale and rotation of the plane, however you may notice that the logo does not really interact with the actor and thus feels lifeless. So to spice things up, we head over to the

Scene panel again and now use the 'Add Object +' button and insert a 'Face Tracker'.

Well, it doesn't look like anything changed but I promise, the real magic is just a step away. Before that, we will suggest that you pause the camera feed using the pause icon on the left side bar, so that you can move around the logo easily. For this effect let's keep the Digit logo above the subject's head. Now click and hold our logo plane and drag it inside the Face Tracker that we just added. Now hold your breath and click on the un-pause/play button on the left side bar, to witness the final magic!

You may use the same technique to experiment with different things in place of the logo.. Sticky logos are not really your kind? Head over to the Assets panel and select the Asset library to browse thousands of assets that you can add into your scene and experiment with as well. Note: you might be asked to sign in when using the asset library for the first time.

Well, that is it for creating a simple enough filter on Spark AR Studio. If you wish to make your effect public and directly accessible from your social media accounts from Meta, just publish your effect and wait for it to get redirected to SparkAR Hub where your effect will have to be submitted for review. Once reviewed, it should pop under your account within a few days to interact with.
