DARKROOM: PHOTO AND VIDEO EDITOR

Getting hands-on with photo editing tools can often be a chore. With Darkroom however, photo editing is a breeze as the software is light, easy, intuitive to use and can do just about everything its almost namesake cousin from Adobe can.

Winner of the Apple Design Award in 2020 and the Best of the App Store Award in 2015, Darkroom has been the go-to application for photo editing for many. However, there are certain features that have gone unnoticed in the eyes of many users, which in fact could be very useful. Here, we've got a list of a few such tips and tricks for you.

MAKE YOUR OWN FILTERS

Tired of using the default presets and filters in Darkroom? Don't worry. Darkroom allows you to make your own filter inside of the app, which you can configure to your liking and use at the click of a button. To make your own filter in Darkroom, go to the filters tab, and start editing your photo in the way that you would like.

Filter menu in Darkroom

Now, go and locate the create new filter button. Check if the button has gone from being translucent to white. When the button is translucent, it indicates that the picture was not edited, and when it is white, it shows that the picture has been edited, the effects are added, and changes made are ready to be saved as a filter. Click on the button. After that, a prompt will appear to name the filter. Give it a name of your liking, and you are good to go! Now every time you open the filters tab, you will

be greeted with your own set of filter(s), listed under the my filters section.

RESET AND COMPARE CHANGES IN A BLINK

When editing a photo, after making a set of changes, if the result are not satisfactory, or you want to know what the original photo looked like, resetting the sliders is often a tough task. There is a feature built into Darkroom, which lets you reset the value of a particular setting, under any menu, to zero.

To use the feature, all you need to do is locate the slider that you want to reset to zero. Double click in the centre of the slider circle, and you will reset the value of the slider. To look at the original picture, without making any changes to the edit that you have made, you will have to click on any part of the picture and hold. After a second of holding down, you will see the original picture. The same can be done with the slider circle

to see the changes made without altering the ones that already have been made.

USE THE HISTOGRAM

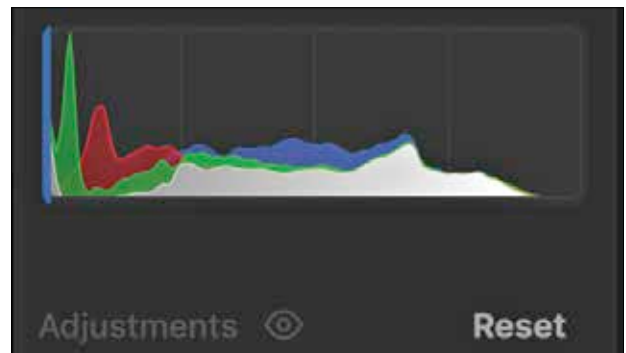

Darkroom has histogram edits being baked right into the app. If in your application, the histogram is hidden, all you need to do is, go to the view tab on the top of the application.

From the dropdown menu, select the show histogram option. This will toggle on the histogram, which will be visible in the adjustment and filter menu. If you would like to disable the histogram, you can simply mouse over to the histogram and right-click. In the menu that opens, click on the hide histogram option.

PROCESS YOUR PHOTOS FASTER

Another time-saving feature like the 'make your own filters' feature is the group photo processing feature of Darkroom. If you clicked a bunch of photos in a similar

The histogram, as shown in the adjustments menu
