

setting of the same subject, then editing each photo individually can be a task, and so can applying that filter you created to each one. By using group photo processing, you can directly apply the edit made to a picture to the others in the library.

Apply the same changes to multiple photos

To use this feature, right-click on the picture, and from the dropdown menu, select the copy edits option. Now, go to the photo that you want to apply the edits to, and right-click. From there, select the paste edits option. The photo will now have the same edits applied to it as the donor photo.

 CREATE ALBUMS AND ORGANIZE

Darkroom allows users to create their own albums and organise their photos. To create a new album in Darkroom, go to the library screen and locate the side menu, where there is a category called my albums. On the right side of the category name, there will be a button, represented by a plus sign, with a circle around it.

Click that button and you will be prompted to enter the name of the album that you want to create. With the album created, start adding photos, either by using the

add photos option in the album or right clicking on the photos in the main library and selecting the add to album option, where you can choose the album that you want to store the photos in.

SKITCH – SNAP. MARKUP. SHARE.

Given the shift of all sorts of workflows to the online medium, after the onset of the pandemic, screenshots have become insanely popular. But, despite the rise in popularity of these apps, there still remains a lot to be done in the stock apps to make them actually useful.

To solve this problem, millions of users across the world have shifted to using third party services like the one we have here, called Skitch. With its integration with the popular note taking app, Evernote, Skitch has become the choice of many. And here we have a set of functions and tricks that will help you get started with Skitch faster and with a lot more efficiency.

 THE MAGIC WITHOUT OPENING THE APP

Skitch is programmed such that everything that you would ever need in terms of taking different types of screenshots is baked right into the dock icon of the application. Just click on the icon of the application in the dock and hold it for a few seconds. A menu will appear

with all the options, including crosshair snapshot, previous snapshot area, full screen snapshot, window snapshot, menu snapshot, and camera snapshot. The image that you capture using any of the options from this shortcut menu will directly open inside of Skitch for you to work with.

The Skitch dock menu

 DEPLOY KEYBOARD SHORTCUTS

Keyboard shortcuts when integrated with an app can make things easier for every user of that application, be it beginners or those at an advanced level. On the right is a list of useful shortcuts, that many people do not know about, and which will help you a lot while using Skitch.

 SHARE YOUR SNAP INSTANTLY

After taking a snap using Skitch, you can instantly share it. To do this, go and click on the bottom grey part of the screen, the one representing the file format, using a small image. Hold that and drag to the application where you want to share it. Drop the file

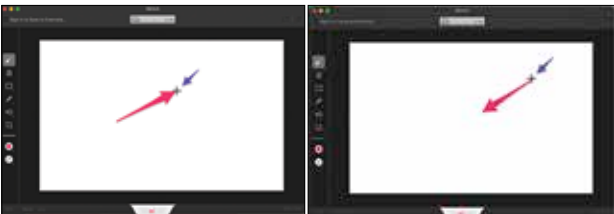

ACTION	SHORTCUT
Crosshair Snapshot	Shift+Command+5
Fullscreen Snapshot	Shift+Command+6
Window Snapshot	Shift+Command+W
Camera Snapshot	Shift+Command+T
Arrow	Option+Command+A
Text	Option+Command+T
Rectangle	Option+Command+R
Rounded Retangle	Option+Command+U
Ellipse	Option+Command+O
Line	Option+Command+L
Marker	Option+Command+M
High-lighter	Option+Command+I
Blur	Option+Command+X
Crop/ Resize	Option+Command+K
Tool Size	Option + Command + 1 through Option + Command + 5
Share via email	Shift+Command+M
Create public link and copy URL	Command+ /

and you are all set. Instead of going through the hassle of exporting the snap and then searching through the myriad of others on your device, this feature can be used.

 CHANGE WHERE THE ARROW POINTS TO

The arrow option on Skitch, by default is set to point in the direction, where the mouse pointer is pointing towards. But certain users might need it to point in a different direction. This can be done by holding down the Option key on your keyboard, while making an arrow. When you do this, the pivot of the arrow that you are drawing will change from being on the tail end of the arrow to the pointy end of the arrow.
