

## Van der Waals

**Funding:** US\$ 165,755 pledged of US\$ 25,000 goal

**Link:** <https://dgit.in/vanderwaals>

**V**an der Waals is a smart Bluetooth speaker that looks extraordinary and ethereal. Named after Dutch physicist and Nobel laureate Johannes Diderik van der Waals, this speaker boasts a ferromagnetic fluid visualisation system that looks anything but run of the mill. The glob of magnetic fluid reacts to the movement of magnetic fields and warps its shape to the beat of the music playing. The Bluetooth speaker is driven by four speakers with an output of 50W, ensuring that it is loud enough to be heard even in large rooms. The creator of this device, Sergei Kuznetsov, said, "With fluid control algorithms, our users can immerse in a breath-taking visual spectacle which can

adapt no matter your taste in music. This visualization adjusts according to the overarching frequencies and music volume, and the liquid itself can be seen from near and far." The magnets within the speaker react to the magnetic field allowing the ferrofluid to contort and move around without any physical intervention. You get two 15W mid-bass speakers, two 15W tweeters, and one passive bass radiator that drives the speaker's sound. The speaker utilises high-quality materials such as tempered glass, anodised aluminium, acoustic fabric and ferrofluid for its body. It comes with Bluetooth v5.1 and weighs 5kg.

## Revopoint POP 2

**Funding:** US\$ 1,466,655 pledged of US\$ 9,970 goal

**Link:** <https://dgit.in/revopoint>

**O**n the backs of the success of the Pop 3D scanner, Revopoint has now launched the latest iteration of their 3D scanner – the Revopoint POP 2. The company has been designing and manufacturing 3D scanning solutions since 2014 and they raised over \$2.2 million for the POP 3D scanner. The POP 2 has already raised 1.46 million USD and is on track to replicate the success of its predecessor. With the POP lineup, Revopoint attempts to offer affordable and easy-to-use 3D scanners for small businesses as well as individuals. The POP 2 is a 2-in-1 3D scanner that can function as both, a desktop or hand-held device. The core hardware adopts principles of binocular and micro-structured light that allows users to quickly get high-precision 3D point cloud data. Additionally, the single-frame accuracy of the device will be able to reach an impressive 0.1mm! With Revopoint's proprietary micro-projection chip, the POP 2 can leverage intelligent algorithms that can ensure speed and efficiency during 3D scanning. Via the accompanying software, users will have two scanning options – high accuracy scan or fast scan. This allows users to customise the scan as per their unique requirements. The scanner can be used with Mac, Windows, Android and iOS platforms but the scanning options are only available on the Windows platform currently. Users can purchase the most affordable package on Kickstarter for around \$420.

## Sportsmate 5

**Funding:** US\$ 166,970 pledged of US\$ 9,989 goal

**Link:** <https://dgit.in/sportsmate5>

**A** fitness-based exoskeleton, the Sportsmate 5 is the world's lightest portable wearable robotic exoskeleton made for consumers according to Enhanced Robotics, a start-up company that developed this product. The Sportsmate 5 is not just your ordinary exoskeleton but it also comes equipped with AI smarts. This lower-body exoskeleton uses artificial intelligence to provide assistance and resistance during fitness activities. The Sportsmate 5 can be worn around the waist and around both thighs and an air bladder on the

inside of the waist section gets inflated to ensure a comfortable and snug fit. The company claims that putting on the Sportsmate 5 merely takes about a minute. The exoskeleton can be used in one of two ways. If the user requires

some motorised help during hiking or trekking, they can simply push a button to select Assistance mode and the Sportsmate 5 will be reared up to assist the user. The sensors placed in the device can detect steps initiated by the user and then the exoskeleton can instantly respond by triggering the device's motors to draw up the relevant leg and push it forward. An AI-based algorithm can learn the user's manner of walking to ensure things run smoothly. This mode delivers up to 18 Nm of torque. On the other hand, if the user wants a higher resistance workout instead, they can select the Resistance mode. The same motors make the wearer exert more energy to move their legs. The Sportsmate 5's planned retail price is \$1,517.
