

Mid-Range Truly Wireless Earphone

Giving premium TWS a run for their money

This year, the mid-range truly wireless earphone category truly gave the premium category a run for their money by offering a gamut of features as well as excellent performance at a much lower price point. From multi-driver setups to excellent noise-cancelling abilities, truly wireless earphones between ₹5,000 and ₹10,000 are fast becoming the go-to category for users who value performance without breaking the bank. We tested several of them this year to bring you the Best Performing Mid-Range Truly Wireless Earphone in 2021.

Winner: Oppo Enco X

The Oppo Enco X earbuds are undoubtedly flagship killers in the TWS segment, bringing premium features and sound to the sub-₹10K price range. It comes with a coaxial dual-driver design which comprises one 6 mm balanced membrane driver that handles all the high frequencies, and one 11mm triple-layer dynamic driver which takes care of the rest of the frequency range. This is extremely unusual at this price point and is a solution that is usually prevalent in high-end Hi-Fi audio devices. The result? The Oppo Enco X is one of the best-sounding pairs of truly wireless earphones we've tested under 10K. The earbuds deliver excellent sound quality with textured and well-defined bass response, detailed mid-range, articulate vocals and sparkly highs. The ANC performance is pretty decent for the price and the microphone is excellent to use indoors and decent outdoors. The one area the Enco X loses out to its competitors is battery life. In our tests, the Oppo Enco X earbuds lasted about 3.5 hours on a single charge with Max Noise Cancellation turned on and the volume set at around 70 per cent. Nevertheless, as a package, the Oppo Enco X gives premium TWS earphones a serious run for their money.

Oppo Enco X

Price: ₹9,999

Google Pixel Buds A-Series

Price: ₹9,999

Nothing Ear (1)

Price: ₹6,999

Runner Up: Google Pixel Buds A-Series

The Google Pixel Buds A-Series feature custom-designed 12 mm dynamic drivers and support the SBC and AAC audio codecs. The buds deliver a fairly balanced, close to neutral sound which really impressed us, but the bass response is a bit muted at the default EQ setting. The Bass Boost EQ setting sounds a bit more dynamic and energetic than the normal EQ setting, but the low bass response is slightly above ideal. As for the mids and the highs, in both EQ settings, they sound detailed and close to neutral. Vocals especially sound great, with excellent clarity and presence. Moving on to the microphone performance, the Google Pixel Buds A series comes with dual beamforming mics on each earbud that picks voices up well. The voice sounds more or less natural with little distortion. Overall, the Google Pixel Buds A-Series delivers solid sound quality.

Best Buy: Nothing Ear (1)

The Nothing Ear (1) is not only an excellent earphone to consider due it comes to its unique transparent design, but it also provides compelling sound quality, ANC performance, and good battery life. The Nothing Ear (1) sports an 11.6 mm dynamic driver and is tuned with the help of Teenage Engineering. The earphones come with a V-shaped sound signature with slightly boosted bass and highs and close to neutral mids. The sound signature works well with genres such as pop, rap, EDM, hip hop, Bollywood, and even rock, to some extent. Priced at ₹6,999, the Nothing Ear (1) offers a lot to like at a significantly lower price than our winner and runner up and therefore wins the Best Buy recommendation in this category.
