

4K HDR TV

As premium as it gets!

Despite the ongoing pandemic, 2021 saw the launch of some of the most interesting TVs we've seen to date. Mini LED TVs launched in India gave OLEDs a run for their money and OLED TVs saw some improvement in performance over their predecessors. We saw the launch of TVs with processors that "think like humans do" and we have more brands than ever launching QLED TVs in India.

Some of the defining trends in the television industry include refinement to TV UIs that bring content before the streaming service, better performance from far-field mics and an improvement to the smart capabilities of TVs.

HDR performance of TVs also saw a boost with features like IMAX Enhanced and Dolby Vision IQ making an appearance on high-end TVs while budget TVs have started offering an acceptable HDR experience.

If you are looking for the crème de la crème TV money can buy, then you need not look beyond what we have here today!

Winner: LG G1

The difference between the winner, the LG G1 and the runner up, the Sony A80J was literally one point in our Digit Zero1 testing. In our tests, the LG G1 recorded higher peak brightness than the Sony A80J, which helped it gain the upper hand. On the LG G1, we recorded a peak brightness slightly below 900 nits. It has all four HDMI 2.1 ports, bringing with it VRR (Variable Refresh Rate), ALLM (Auto Low Latency Mode) along with being G-Sync and FreeSync compatibility, making it the ideal choice for PC and console gamers. The overall

Sony A80J

Price: (MOP):

₹2,79,990 (65-inch)

Samsung QN90A

Price: (MRP):

₹1,75,990 (55-inch)

gaming performance of the TV using a PS5 and Xbox Series X was sublime. Under the hood, the TV has LG's $\alpha 9$ Gen 4 processor with AI picture processing and upscaling. It also has a Filmmaker Mode that showcases content the way it was intended by the content creator. The OLED TV supports 4K, HDR, Dolby Vision IQ and Dolby Atmos. LG's UI has seen a redesign in 2021 and now offers a full-screen experience-enhancing on top of what was already a very good UI. The remote control has also been redesigned with better ergonomics. In addition to far-field mics, you also get access to both Amazon Alexa and Google Assistant from the comfort of the remote control.

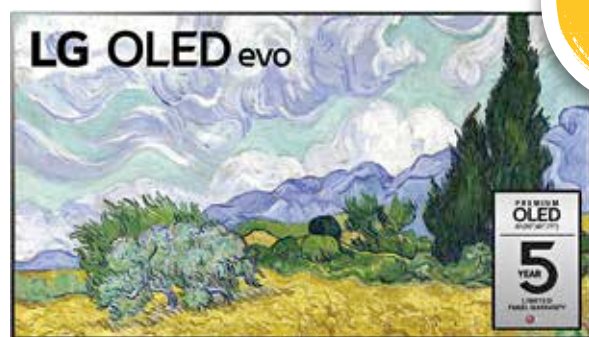

Runner Up: Sony A80J

The Sony A80J is the perfect TV for cinephiles! The BRAVIA XR processor under the hood makes the content look natural and true to the source and other enhancements such as XR OLED Contrast, XR Colour, XR 4K Upscaling, XR Clarity and more ensure you get the best picture possible for whatever content you are consuming. It loses out to the G1 in the peak brightness test and the gaming performance test. Despite this, the A80J is no slouch, touching peak brightness slightly below 800 nits. The TV only has two of the four HDMI ports that support HDMI 2.1 and while it does support 4K at 120Hz, the TV was yet to receive an update to get VRR support as of our testing the TV for the Digit Zero1 Awards. Audio performance is where this TV shines. The Acoustic Surface Audio+ technology not only helps with good channel separation but also clarity in dialogue. The Sony A80J runs on the new Google TV UI and comes with far-field mics for hands-free controls

Best Buy: Samsung QN90A

If there is one TV that works extremely well in a well-lit room and a dark room, it is the Samsung QN90A QLED TV. The TV can achieve peak brightness closer to 2000 nits, making it perfect for those of you that consume content in the day and can't control the natural lighting in the room. The TV can produce content extremely well with punchy colours. The Intelligent Mode on the TV works extremely well and changes the picture preset to suit the content being played which is a huge boon. The TV has only one HDMI 2.1 port for 4K 120 Hz gaming of the four ports with a second port supporting eARC.
