

thinnest 15" and 17" laptops to date. We've always listened to what our customers want and brought about some major changes to our design language as well as thermal capabilities. In the Alienware X-Series, we engineered the next evolution of our Alienware Cryo-Tech™ cooling technology which introduces Element 31, an exclusive thermal interface material (TIM) concocted from Encapsulated Gallium-Silicone liquid metal compound. This material exists between the CPU and its thermal elements to disperse heat and mitigate spikes in core temperatures from affecting the system's performance. Unlike what's currently available on the market, X-Series delivers up to a 25% improvement in thermal resistance advantage with Element 31.

Q From a core product perspective, gaming laptops still seem to have a few limitations (thermals and footprint), when it comes to pure performance and how far one can go on the design front. What are Dell and Alienware doing to stay on top of the curve?

Anand: This is exactly what we have tried addressing with our new Alienware X-Series. When developing the X-Series, we wanted to provide the gaming community with more than just your everyday thin gaming laptop. We wanted to challenge the status quo and create something that redefines the ultimate mobile gaming experience. Advancement in thermal technologies within mobile form factors continues to be the number one request from our customers. Besides engineering Element 31 for hyper-efficient cooling, we also introduced a new positioning of the fans. The new Quad-Fan technology is an industry-first exclusive and patent-pending design. This new design includes a combination of standard evacuative fans which move air through the system as well as, patented, dual opposite outlet (DOO) fans. DOO fans blow air through the system, through the chassis, and over various internal hotspots. By doing so, they create

a pressurised environment where air floods the inside of the chassis while also pushing air out making them excellent help towards the dissipation of heat which aid in the reduction of skin temperatures (external temperatures to the touch) and/or gaming performance. In this Quad-Fan design, each fan is also intelligently controlled and uniquely programmed. Depending on the thermal conditions of the system, any fan may ramp up or spin down in order to meet the desired equilibrium or new target state.

“We wanted to provide the gaming community with more than just your everyday gaming laptop. We wanted to challenge the status quo and create something that redefines the mobile gaming experience.”

The technologies allow gamers to enjoy their favourite games at high performance within an exceptionally thin form factor while maintaining an impressive level of quiet and coolness.

Q Alienware just turned 25! How is Alienware celebrating its 25th Anniversary in India?

Anand: Our 25-year old legacy is a strong statement of the strong engagement we share with our consumers and our gaming community particularly. Our secret sauce, while there really is not one, is a combination of our commitment to fuel technology innovations and understanding the gaming community closely.

On this special occasion globally, we have announced the new Aurora desktop. The Alienware Aurora is a reflection of the ecosystem's strong

need for a true computer dedicated to serving PC gamers. Alienware Aurora, our flagship desktop that pioneered the liquid-cooling movement, stood as a symbol of innovation when it was introduced in 2004 (recognised as the Aurora ALX back then) and has since become the mid-tower desktop of choice for the world's best esports players in the most demanding, high-stakes tournaments. The Alienware Aurora is available for our global consumers and is soon making its way to the Indian market. To explain this in terms of a few features, the new Alienware Aurora debuts an open-air design that reorganizes its inner components to promote better accessibility, greater airflow, improved acoustics, and cleaner cable management – enriching the gaming experience in every possible way. This new open-air design increases internal chassis volume by a whopping 50% without significantly expanding the overall footprint of the chassis. The result is more efficient total airflow and a reduced acoustic profile that provides gamers with a more enjoyable daily experience. All while providing a 5% increase in graphics performance.

The Alienware Aurora mirrors the kind of high-tech innovation we stand for as a brand.

Q With the launch of the Alienware X-series, can we expect even slimmer and lighter gaming laptops from Alienware in the future?

Anand: While Alienware's X-series laptops are purpose-built to deliver high-performance in boundary-pushing designs, our M-Series can be more versatile and introduce new components more quickly as its chassis offers greater freedom. We invest a significant amount of R&D into this family to discover new materials and invent breakthrough cooling solutions, which results in longer planning and engineering cycles. Our portfolios are designed to cater to users as per their tailored needs and hence we will continue to innovate and engineer new designs that set Alienware and our gaming community a class apart. **d**
