WHAT'S NEW

Not enough computing power for an immersive metaverse

Intel today talked about Metaverse, the upcoming connected virtual world that everyone wants a piece of, and acknowledged that it "may be the next major platform in computing after the world wide web and mobile". However, it also cautioned that we still have a long way to go before we get to the utopian dream. Intel says that we don't have nearly the computing power that's needed to drive such a virtual experience. In fact, we are not even close. "We need several orders of magnitude more powerful computing capability, accessible at much lower latencies across a multitude of device form

factors. To enable these capabilities at scale, the entire plumbing of the internet will need major upgrades,"

says Raja Koduri, Senior VP, General manager of the Accelerated Computing Systems and Graphics Group at Intel in an editorial. "Truly persistent and immersive computing accessible by billions of humans in real-time will require 1,000-times increase in computational efficiency from today's state of the art." <https://dgit.in/metaversetoday>

Meta joins forces with the CBSE

It looks like the Central Board of Secondary Education has joined hands with Meta (formerly known as Facebook) on an ambitious AR/VR project. The company will train more than around a crore students as well as 10 lakh teachers in new educational methods involving Augmented Reality as well as Virtual Reality. Courses such as Digital Safety and online wellbeing will be offered under the curriculum.

This marks a significant step for Meta as this is a rare occasion where the company is able to partner with a government educational institute for

a brand-new, tech-focused curriculum. In a statement to the media at the Fuel for India 2021 event, Mark Zuckerberg said, "We are investing in other

growing areas like education and commerce through Unacademy and Meesho, which are important use cases as we think about the future that we are building. We want to continue to partner in all of these areas as we accelerate the development of the fundamental technologies, the social platforms, and creative tools that are going to be necessary to bring the metaverse to life."
