

BreaThru

Funding: US\$ 20,898 pledged of US\$ 3,000 goal

Link: <https://dgit.in/breathru>

In these turbulent times, it is handy to have a portable spirometer that can assist you with checking your lung function at any time. BreaThru is just that. This tiny, inconspicuous gadget allows users to test their lung function on the go in real-time. BreaThru's inbuilt display shows a dynamic colour scale that changes according to your lung function. The company says that this device can allow users to not just monitor their lung capacity but also can help predict potential chronic disease, heart diseases and monitor recovery from any pulmonary ailments. Owing to its compact size, users can self test themselves whenever and wherever. The gadget also connects to BreaThru's smartphone app that stores the data it collects for long-term monitoring. You can also use the gadget to quickly glance through your last 5 readings to monitor any potential trends. BreaThru can be used to monitor your progress while working out over long periods as well, to see any potential improvements in stamina and lung endurance. The device houses a BOSCH sensor that monitors the gas flow rate (L/min) and gas pressure (P). The device can be fully charged in an hour, and one charge provides a whopping 5 months of battery life. The mouth-piece that you breathe into is also removable and washable. The MRP of the product is USD69 while the Early Bird pledge price of the product is USD39.

DWARF II

Funding: US\$ 632,287 pledged of US\$ 15,386 goal

Link: <https://dgit.in/dwarf2>

Building on the success of the first-generation DWARF smart telescope, the company Tiny-ScopeCAM has now launched the second iteration of the product on Kickstarter – the DWARF II smart telescope. Aimed at stargazers and birdwatchers, the DWARF II is a portable smart periscopic telescope powered by a 4-core Cortex-A7 1.5 GHz processor. The telescope leverages artificial intelligence algorithms to automatically pan and tilt to the desired location. The telescope features dual lenses – a wide-angle camera and a telephoto camera. It also comes with auto-focus and object tracking capabilities. The latter is achieved by selecting a target object by framing it and then using the Object Tracking feature in the DWARF app to follow or track it. For the stargazers out there, DWARF II can automatically track these celestial bodies using field-rotation-correction algorithms. This is done to identify the path to watching stars while correcting the natural field rotation that occurs due to the movement of the celestial bodies in the sky. The telescope is also capable of capturing panorama shots by capturing multiple images via 2-axis scanning and then merging them into a single image. The device weighs 1.4kg and can be carried around in backpacks pretty easily. You can get your hands on one for USD349 on Kickstarter.

HalfDive

Funding: US\$ 210,686 pledged of US\$ 173,848 goal

Link: <https://dgit.in/halfdive>

It seems as though numerous companies keep coming up with gadgets for the ultimate home-bodies and lazy souls to make them lazier and more introverted. HalfDive is a VR system that is specifically designed for use in bed (!). There goes one more reason to get out of bed. While video games made you forget the outdoors and be confined to your gaming space, this gadget has taken it to the next level and eliminated the reason to even get out of bed to play a VR game. Okay, that tangent aside, we do acknowledge that this will allow dis-

abled people to enjoy VR games and environments but we can totally see a lot of gamers buying this gadget as well just to enjoy the comfort of their bed. HalfDive comes with a 134-degree FOV (field of view), manual IPD adjustment, a high-resolution LCD screen with 90Hz refresh rate, and four speakers. The device is even

capable of automatically moving over a user's head and positioning itself so you don't need to do it manually. The VR system also comes with force and wind feedback that bumps up the immersiveness of games as well. The company also says that the headset is compatible with SteamVR thanks to OpenVR integration. As for the controls, there are a pair of cabled cuffs that users need to put their hands into. Hands actions will then be registered and relayed in game. Additionally, since the programs and designs of HalfDive's body and modules are open-source, users can 3D print original modules (that fit HalfDive's broad design). The basic model is priced at USD750 (Early Bird Price) while the more expensive package is priced at USD1,050.
