

Smart collar for your pet

This smart dog collar can help you monitor your pet's vitals and help track their location. <https://dgit.in/jan22-27>

Xiaomi 12 and 12 pro launch

Launching in April, the phones could be the first in the country with Snapdragon 8 Gen 1 processors. <https://dgit.in/jan22-28>

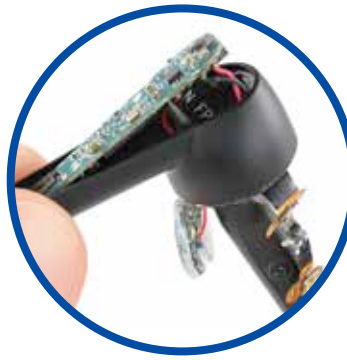

Examining the motherboard

One side of the mainboard houses an indicator LED, spring contacts that register the touch controls, and spring contacts for charging the buds in their case. The other side holds some more interesting chips such as the Airoha AB 1562 Bluetooth audio SoC, the main microphone, Active Noise Cancellation microphones, and proximity sensors for in-ear detection.

Fairphone True Wireless Earbuds

Non-modular components

Most of the important components tucked inside the Fairphone True Wireless Earbuds are non-modular, which is a huge blow to repairability, something Fairphone is known for and even stands for. A lot of heat and some tools are required to remove some of the internals including the motherboard, driver, and battery.

Battery removal and destructive fasteners

The battery is the next in line to be removed. The tiny battery delivers 0.1Wh (50mAh @ 3.7 V) which is approximately on par with the AirPods Pro's battery. To get to the driver, you will encounter a ribbon cable that is held between brackets. These brackets are secured by plastic rivets that make it very hard to remove without damaging them.
