SCI-FI FILMS AND ANIME IN 2022

Some of the best sci-fi anime and movies to look forward to in 2022

Deeksha Devadiga |
feedback@digit.in

As 2021 comes to a close and theatres finally re-open, many movies that were stalled due to the Covid-19 pandemic will finally release on the big screen. A large portion of the calendar for 2022 is loaded with blockbuster films that not just reveal new characters and universes but also bring new story arcs for existing characters with large fan bases. From Marvel and DC superhero films to more exemplary sci-fi movies, and everything in between, there's such a huge amount to anticipate in the following year. This article, however, is limited to sci-fi films and anime that will be released in 2022. Sci-fi, a genre that was more niche at one point in time, is now becoming more commonplace. This is primarily due to massive budgets being allocated to sci-fi films

causing an influx of notable directors and actors (voice actors in the case of anime). The time is ripe to get into this genre if you haven't already since 2022 is stacked with some exciting sci-fi releases. Here's a list of the best sci-fi films and anime that you must look out for in 2022.

MOVIES

Morbius - January 8, 2022

Initially scheduled to release on July 10, 2020, Morbius has been postponed multiple times already, much to the dismay of those who were really looking forward to this film. Now, Morbius is finally set to release on January 28, 2022. Let's keep our fingers crossed that it doesn't get postponed yet again. It brings to the big screen biochemist Michael Morbius who, in the quest to cure his rare blood disease, infects himself and turns into a living vampire. Oscar-winner Jared Leto will star in the titular role as Morbius, and Michael Keaton is set to return to his role as The Vulture in this film, indicating a potential greater MCU hybrid. Directed by Daniel Espinosa alongside

screenwriters Matt Sazama and Burk Sharpless, this film will bring vampires into the Marvel universe and it is said to have a darker tone as well, which has some fans excited. The anti-hero character Morbius will be torn between saving lives and his newfound blood-lust.

Moonfall - February 4, 2022

As the name suggests, the moon does fall in this movie as a mysterious force directs it towards Earth, threatening to crush our planet and everyone on it. The sci-fi movie explores the possible disaster that could be caused by the moon crash-landing onto our planet. The film stars Halle Berry in the role of a NASA executive and a former astronaut who must figure out how to stop the potential doomsday while having little to no support from anyone. Director Roland Emmerich is back again with a sci-fi thriller and adds some apocalyptic chaos to the mix. It's looking like a really exciting film to look forward to. If his body of work is any indication, we can surely expect a lot of explosions and havoc being raised. The film also stars Patrick Wilson, John Bradley, Michael Peña, Donald Sutherland, Charlie Plummer, Eme Ikwuakor,
