5 WATCHES WORN IN SPACE

This one goes out to all the aspiring aviators and horologists out there!

2

O21 marks 60 years of the first manned mission to space. Humankind embarked on its

journey to the stars and what is beyond for the first time in 1961. Since then the purposes of each mission, their outcomes, historical as well as scientific implications, as well as the equipment which made it possible, have captured our imagination.

However, none of them has captured popular imagination over the years as much as the humble wrist watch has. Yes, you heard that right! Why, you ask? It may be because wrist watches are so familiar to the rest of us, whether or not one may be interested in space travel. Watches that can withstand gravitational forces in excess of 6 g (g-force), temperature fluctuations of between -160 to +120 degrees, as well as severe

changes in external pressure in space are a constant source of marvel, a fascination as old as the one with space exploration itself.

So here, we bring you a selection of five watches worn in space-

1. STURMANSKIE WATCH

The Soviet Union, in addition to having the distinction of being the first nation to put a man in space, also holds the distinction of having made the first watch to ever be worn in space. Yes, that's right! The Moscow Watch Factory, since 1954 manufactured the Sturmskie as a special issue watch for Soviet Air Force pilots. It was known for its easy to read watch face, with big, bold numbers arranged in a twelve hour format, with a red seconds hand, and sword style minute and hour hands. Each Sturmskie, in addition, also

had wings signifying flight, with the Red Soviet star in the centre.

2. OMEGA SPEEDMASTER PROFESSIONAL

Arguably the most famous amongst the crop of watches worn in space, the Omega Speedmaster became the first watch to be worn on the moon on July 21st, 1969, when Buzz Aldrin wore it for his moonwalk. The watch Aldrin wore in particular, however, now remains as a lost piece of history, since Astronauts were required to return their watches to NASA post completion of their mission, and Aldrin's watch mysteriously disappeared when it was being transported to the Smithsonian Museum to be preserved.

Contrary to popular belief, this wasn't the Omega's first spaceflight. The Speedmaster was first worn in space by military pilot Walter Schirra, which he bought a few months before the Mercury-Atlas

8 mission, perhaps to mark the occasion, which was carried out on October 3rd, 1962. It was in the aftermath of this mission, that NASA Program Manager and Aerospace Engineer, Jim Ragan was appointed to find mechanical watches which could be used as back-ups to digital timers used on missions. For the same, Omega, Longines, and Rolex sent in the Speedmaster, the 235T, and the 6328 "pre-Daytona" Chronograph respectively. Each watch was subjected to a series of gruelling tests which included exposing them to temperatures varying from -18 to 93 degrees Celsius, being placed in pressure chambers of between 10-6
