Twitter fined by Russia

Twitter was fined 3 million roubles (\$40,920) for failing to remove content that Russia deems illegal <https://digit.in/jan22-32>

atm (atmospheres), being exposed to steam with a humidity of at least 95 per cent, in an environment of 100 per cent oxygen for at least 48 hours, exposing the watches to shocks of 40 g each, and acceleration from 1-to-7.25 g in 333 seconds, amongst others. Out of the three, only the Omega Speedmaster withstood the tests, with the other two having failed in the first test itself. It was therefore certified for use during Extra Vehicular Activity (EVA), or in common parlance, “spacewalks,” and remains the only watch to have done so till date.

3. POLJOT STRELA

Poljot's Caliber 3017 Strela was a standard issue watch for all Soviet Air Force pilots as well as cosmonauts between 1959 and 1979. On March 18th, 1965, the Strela became the first watch to be worn in outer space as Cosmonaut Alexey Leonov, the first man to “walk” in space, stepped out of the Voskhod 2 wearing the watch. The model Leonov wore had a white dial with applied gold numerals at 12 and 6 o'clock, while 1,2,4,5,7,8,10 and 11 o'clock were marked by narrow gold wedges. Strela's remain in production till date, and are available for purchase

in the market, for those looking to own a little piece of space, as well as horology history!

4. BREITLING NAVITIMER COSMONAUTE

Lieutenant Commander Scott Carpenter was the first person to wear a Breitling in space. Each of the seven Mercury programme astronauts was given one special responsibility of the spacecraft, and Scott was given the

responsibility for the development of onboard navigational equipment.

Having worn a Breitling Navitimer for much of the 1950s, it was the obvious choice for Scott, for his trip to space. However, Scott recommended Breitling to make three major changes to the watch so as to make it more usable in space. The first modification was widening the standard watch's bezel from 40.5 to 42.5 millimetres, such that it could be used by astronauts wearing thick gloves and protective gear. The second modification he recommended was the removal of the third scale, to make the dial less ‘busy’, and third, changing the watch to a 24-hour format, so as to make it easier for astronauts to tell the time, whether it was in AM or PM.

The Navitimer was a watch designed for pilots developed jointly by Breitling and the Aircraft Owners and Pilots Association. Since its introduction in 1954, the Navitimer had three scales- two printed within the dial and one in the rotating bezel. The two standard outer scales can be used for multiplication as well as division, whereas the third dial can be used for making calculations pertaining to speed and time. The third scale also translates minutes to hours, shown in an HH:MM format. The numerals on the watch followed a 12-hour format.

This new watch developed by Breitling as per Scott's specifications was referred to as the Cosmonaute, commonly identified by the reference number 806 given to it in 1961, a year before Scott's trip to space.

Scott's own Cosmonaute however, which he received in 1962 just three days prior to his mission, remains lost. Upon his return to earth, his craft landed 250 miles further away from its intended splash point in the Caribbean sea. Since his arm was submerged in the water as he awaited to be reduced by U.S. Naval vessels, his Breitling, which unfortunately was not waterproof, suffered great damage. As per sources, his watch was never seen after being sent to Breitling for repairs, and its current whereabouts remain unknown.

5. HEUER 2915A

This one holds the distinction of the first Swiss watch to be worn in space, worn by American astronaut John Glenn using rubber bands over his spacesuit on the four-and-a-half hour long ‘Mercury-Atlas 6’ mission in 1962. Furthermore, besides the

aforementioned Sturmanskie, the Heuer remains the only other watch worn in space which wasn't custom built for the purposes of a backup timer for a mission. It was noted for its simple two register dial, with a 12-hour and a 60-minute subdial. In addition to the small dials on the two registers, the rest of the dial consists of a single, long, leaf-style hand, and markers as accurate as one-fifths of a second. Since it was never produced in large numbers, the 2915A remains an elusive watch for horologists the world over. However, Tag Heuer, to commemorate 50 years of Heuer's achievement, released a limited edition Carrera 1887 SpaceX in 2012. [d](#)
