

Bell & Ross BR 01 Cyber Skull Sapphire Watch

An all-sapphire construction watch. As crazy as it may sound, the folks at Bell & Ross have gone and done just that with their latest BR 01 Cyber Skull Sapphire Watch. This limited edition unit looks like a watch has been placed inside a diamond (a massive diamond that is) and only 10 examples will ever be made. The front is dominated by a

simple and elegant watch face with just the minute and hour arms, behind which lies the skull and crossbones symbol that Bell & Ross is quite famous for. The back is entirely see-through revealing the intricate mechanisms that make the watch arms move. That too is in the skull and crossbones pattern. The out of the world construction though does come at the price of reduced resistance to water and it is only water-resistant up to 30 meters which is on

the lower side when compared to other luxury watches. But that shouldn't really matter as we don't think anyone buying this watch is going deep-sea diving with it considering it costs a whopping \$1,17,000 (approximately ₹1.27 crores).

Phractyl Macrobat

The search for personalised, compact air transport has seen some of the strangest and most out of this world designs and the race to become the first to achieve that lofty goal is well and truly on. A South African start-up called Phractyl has revealed their version of what a personal air transport vehicle may look like and this one is envisioned to take on Africa and its minimal land-based infrastructure. The Macrobat, as it's called, is still a concept and is an eNVTOL (Electric Near-Verticle Takeoff and Landing) vehicle which means that it does not need long runways to use thanks to a pivoting wing design. It also has multiple piloting modes. For example it can be piloted normally by a person at the controls within the aircraft and it can also be piloted remotely like a drone which makes it capable of carrying people as well as cargo. The aircraft has a maximum speed of 180 km/h, and a payload capacity of 150 kg. Rather than the traditional landing gear, the aircraft comes with tracked legs that help it take off and land even off of uneven surfaces. There is no word on the launch of this concept, nor has the company provided any development timeline. Doesn't stop us from wanting to get our hands on it ASAP though.

Tesla Cyberquad

A couple of years ago, the Tesla brand unveiled their all electric pick-up truck with a flamboyantly angular design and cutting edge specs. At the very event where the Cybertruck was unveiled, Tesla also teased a quad bike or ATV with the same kind of design theme as the Cybertruck. Although the ATV was not spoken about at all at the launch event, a lot of people thought that it might be something that Tesla is working on as well. Well, those people were right. Kind of. The ATV shown off at the event was a full-sized version fit for a grown adult, but what they did end up launching was a smaller version for kids. Tesla says that the quad can be used by anyone over 8 years old and can haul 68kgs so it could also potentially be enjoyed by smaller-sized adults. It has a 36V battery pack that takes five hours to charge and has a range of about 24 km with a

top speed of 16 km/h. The Cyberquad is available for \$1900 and is currently only available in the US with no news of it being launched in other countries.
