COULD YOUR NEXT LAWYER BE A ROBOT?

AI is already being used by the legal community, but could an actual robot be your lawyer?

Harshita Arya | feedback@digit.in

WHAT IS A ROBOT LAWYER?

A robot lawyer or robo-lawyer refers to a legal AI application that performs tasks that are typically done by paralegals or young associates at law firms. Some commentators say that legal AI is, technically speaking, neither a lawyer nor a robot and should not be referred to as such. However, artificial intelligence (AI) software systems and computer programmes that can update and analyse themselves are becoming increasingly popular. They are increasingly being used by the legal community.

WHY DO WE NEED A ROBOT LAWYER?

You'd think that human attorneys would be concerned about AI invading their territory. However, some are thrilled because the programs or algorithms can swiftly comb through and sort massive amounts of case information. Artificial Intelligence (AI) also aids human lawyers in writing legal letters. These systems may help enhance productivity, reduce backlogs, ensure accuracy, and aid attorneys in improving

the versatility of the services they offer. It may also have an indelible impact on document assembling, time monitoring and billing, job management, contract analysis, legal research, and data analytics in litigation. This help can prove to be crucial, particularly in countries with impossibly vast backlogs.

Professor Richard Susskind, who leads the Lord Chief Justice of England's advisory committee, highlights that in the country of Brazil, a court has a backlog of more than 100 million court cases. Another expert group, Felix Steffek and Ian Dodd highlighted how both sides may have obtained better or worse

results under other conditions. More processing power has aided artificial intelligence in the legal community. Will this early level of AI development be restricted to merely descriptive analysis, or will it be capable of assessing rules and events? That's what remains to be seen.

Artificial Intelligence "robots" can be used as legal aid in many areas. Some of these include-

1) Organisational Lawyers

Many organisations use robots to help them operate their businesses. Some organisations also have instruments that assess the compliance of their operations and policies with international legislation. They can do tasks traditionally performed by attorneys, such as client interviews and contract preparation.

2) Legal Consultant

They assist consumers in locating the appropriate answers to their legal queries and difficulties. Robot legal advisers are now lowering the cost of
