

Apple undergoes antitrust probe

Competition Commission of India launched an anti-trust probe into how Apple runs the App Store. <https://digit.in/jan22-57>

Apple offers bonuses

Apple is offering its employees a \$180,000 bonus to prevent them from defecting to rival Meta. <https://digit.in/jan22-58>

legal services by making it simpler for clients to obtain legal advice before meeting with a human lawyer.

3) Corporate Lawyer

Robot attorneys carry out corporate legal responsibilities such as conducting research, offering legal opinions, and informing corporations about fundamental compliance. However, programmers have created an AI lawyer that can help a corporation make a legally enforceable agreement with another company or entity.

4) Real Estate Lawyer

Real estate lawyers are experts in the laws that govern property transactions and negotiations. However, lawyers who manage the real estate properties are extremely busy. There are several tools and software on the market that can assist real estate owners in keeping track of their interests and commitments.

Now, with the types of robo lawyers out of the way, let's look at examples of three lawyer bots in use today:

DoNotPay, a legal service chatbot created by Joshua Browder, bills itself as the

world's first robot lawyer. The chatbot was originally designed to challenge parking charges, but it has now extended to incorporate additional services. The author claims an overall success rate of 80 percent, although this decreases to 65 percent for parking tickets.

Chrissie Lightfoot, entrepreneur and legal futurist based in

Yorkshire created the Robot Lawyer LISA. It is an AI-powered contracts tool that saves startups, real estate companies, and consumers time, effort, and money. LISA levels the playing ground by allowing everyone to construct a customised NDA that will protect them. A property package also includes three more contract tools for establishing business leases, residential leases, and lodger agreements.

ROSS

ROSS, Arruda, Dall'Oglio, and

Ovbiagele co-founded a legal research engine that employs artificial intelligence to automate legal procedures, making them more efficient and cost-effective. ROSS is based on IBM's Watson cognitive computer. Lawyers may pose research questions to them, and they may answer by reading the law, obtaining evidence, and making inferences. Because AI attorneys, like ROSS, are not paid, legal companies may be able to charge reduced costs.

Robot lawyers or legal aids in the future are very much inevitable. Much like email transformed the way we do business every day, AI will become ubiquitous — an invaluable assistant to almost every lawyer. A major concern is whether AI will genuinely replace attorneys, as appears to be the assumption. And, if so, are there any ethical or moral quandaries that should be explored about AI and the legal industry? In our opinion, the issue is, will people who did not adapt and welcome change be left behind in some way?

It is true that attorneys are burdened and need to be liberated from the mundane duty of data collection to focus on the more valuable work of assessing outcomes, thinking, and advising their clients. These are professions that will *almost* always necessitate the human touch. AI may simply be a tool to assist attorneys in doing all of this more efficiently, quickly, and affordably. While algorithms are great at processing

data, they fall short when it comes to emotional intelligence and human judgement. Complex areas of statutory law, such as tax, will gain from technology's greater processing abilities, but people will *almost* always be better at negotiating agreements, settling disputes, and making ethical decisions.

Algorithms will undoubtedly affect legal practice in the future, even if they will not completely replace attorneys. Dispute resolution is likewise expected to be transformed by technology. Virtual courts may replace the traditional courtroom where all parties gather. From the start, the lawyer may shift from fighting the matter to designing smart contracts.

Many individuals avoid going to see attorneys not because they don't need them, but because they are expensive. The good ones, that is. And if you were looking for money, you might not have much to take home after visiting a lawyer and paying their legal costs.

Some may say, the elite are catered to by the human legal profession. Those who can afford to pay exorbitant prices. Large swaths of the population, particularly the most vulnerable, are left out in the cold. Where human attorneys have failed, robot lawyers could succeed. They can provide legal assistance to impoverished and disadvantaged areas in great need. The legal profession and the practice of law are evolving. There may be numerous issues that the profession will confront in the next few years, but no one can anticipate what the legal profession will look like in the future. One thing is certain: the number of robo-lawyers is certainly growing. **d**
