

MuTalk
Microphone

a muzzle strapping to your face, blocking out your voice so that it is only heard in VR and not by your family or neighbours. It can also be used when two people share the same VR space so that their voice is not picked up by two microphones at once eliminating echoing. Its

expected price is around \$200 when it is released.

HaritoraX

HaritoraX is a motion-tracking device for waist and leg movements compatible with SteamVR. It runs for 10 hours on a built-in battery

HaritoraX

and can be combined with most VR headsets on the market for a remarkable full-body tracking experience. HaritoraX does not need any base stations to set up and is considerably cheaper than its competitors that use base stations. It also eliminates the problem of occlusion that camera-based, or laser based body trackers face. It's currently up for pre-orders for a price tag of \$270.

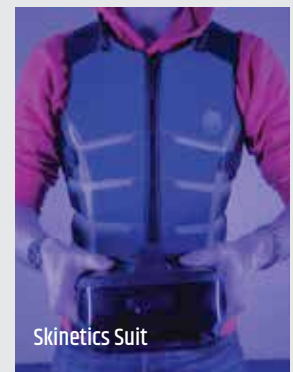

OwO Haptic Suit

OwO is a company aimed at making games more immersive with its host of VR Haptic products. With its aim to make games more immersive and realistic, OwO invented a suit that can help its users feel different kinds of sensations ranging from pain to being virtually hugged. This haptic suit utilises electro-stimulation to provide over 30 types of sensations. Unlike traditional VR haptic suits, the OwO suit does not utilise vibration motors, but rather a set of dry electrodes in the suit. As a result, it's in the form factor of a very thin and lightweight skin suit, and is not at all bulky like other suits. It will be released within this year with an expected price tag of \$500.

Actronika Skinetics VR Haptic Suit

The Skinetic vest invented by Actronika allows users to feel real-life sensations for distinct virtual experiences. It allows for a completely immersive experience in anything from gaming to training. The haptic experience is so immersive

Skinetics Suit

it is capable of shifting the haptic experience to appropriate parts of the body if the user decides to change the orientation of their body. Skinetic distinguishes itself from the competitors due to the authenticity and variety of feelings it offers. The vest is equipped with 20 proprietary vibrotactile voice-coil motors that can generate a wide spectrum of vibrations, covering 100 percent of human vibrotactile sensibility.

Actronika examined the variances in sensitivity of the human body to map the tactile feedback sites in the vest in order to maximise the users' perception and appreciation of the sensations.
