

PROCESSORS AND GPU 2022

By Nayan Panda

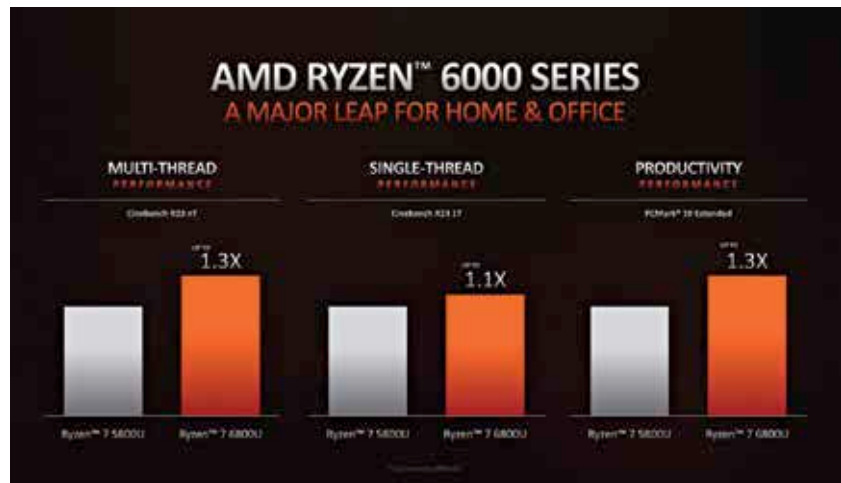

CES typically brings a slew of chip announcements that set the tone for the coming year, and CES 2022 has been no exception. As a ray of hope for the ongoing scarcity, AMD and Nvidia come forward for a deliberate effort to build low-cost GPUs that will hopefully be widely available. This year's CES also witnessed AMD and Intel's release of next-generation CPU architectures, along with a bunch of promising surprises for gamers and laptop users.

AMD

Team Red had basked in quite the limelight with their previous generation of 5000-series CPUs, and this time around they claimed no less of a revolution with their products. 2021 was a great year for laptops and AMD appears to have recognised the potential for mobile chipsets too. They weren't shy to unveil a whole bunch of new and improved chipsets, from the RX6850M to the all new AMD 6000 Mobile CPUs for laptops.

AMD's RX 6000S, RX6000M GPUs:

AMD Mobile GPUs are apparently being focused on efficient energy usage rather than philandering pure performance outputs. The company revealed the Radeon RX 6000S, a new mobile GPU series, at CES. The graphics chips should be available in laptops that weigh less than 4.5 pounds and have a thickness of less than 20mm

(0.78 inch). They claim their new sets of mobile GPUs to be made for ultra-portable laptops that might be taken to work yet utilised for gaming, giving the best of both the worlds while at it. AMD also presented the Radeon RX 6850M XT, the company's fastest GPU till date for mobile gaming, targeted at high-end gamers. It still employs TSMC's older 7nm manufacturing process, but thanks to faster memory and higher clock speeds, it promises to be 7 percent quicker than the previous Radeon RX 6800M. In addition, they are developing the Radeon RX 6650M

XT and RX 6650M, both of which will give a 20 percent performance boost over the current Radeon RX 6600M.

AMD 6000 CPUs:

Talking about gaming, AMD is bringing quite a lot to the table for the laptop market. AMD's next-generation mobile CPU, based on the new 6nm process and Zen3+ architecture along RDNA 2, now also includes hardware ray tracing. That is not all, as these new CPUs will bring along support for PCIe 4.0, Wifi 6E, USB4, DDR5 and LPDDR5 RAM and more.
