

GAMING @ CES 2022

By Paarth Pareek

Alienware Concept Nyx

Concept Nyx is exactly what it calls itself, a concept. However, it is a very interesting one. Nyx will supposedly allow players to pause and play their games on different screens

without having to restart from the most recent checkpoint unlike the services that are available to consumers as of now which only let the players reload from their last checkpoint on the new device they have just shifted to.

Now, how they do it is by reimagining the relationship between your devices that are connected to the same network. Instead of assigning one PC to your service, they make it act as a server so that all your devices are connected

to that one server. This allows players to change screens/devices without having to change the state of the game.

Razer Blade 2022

Razer announced its latest lineup of gaming laptops and being one of the best Gaming Laptop makers, their refreshes of their 14, 15.6, and 17.3 inch models, was certainly big news. Their latest refresh adds new cooling features, a new keyboard layout, and most importantly, DDR5 RAM. Apart from these

sick features, consumers will have the option to have GPUs upto the mythical beast which we know as the 3080Ti. We're really keen on seeing how Razer manages to keep their notebooks cool seeing to the fact that they all have such slim designs. They will also allow the consumers to choose between Intel and AMD on their CPUs with their Intel lineup going up to the i9-12900H and the AMD variants offering the 6000 mobile series. Other improvements include new resolutions to the UHD model of the 14-inches, boosted refresh rates on the 15.6-inch one, and a larger internal battery along with boosted speakers on the big boy, the 17.3-inch model.

HyperX Cloud Alpha Wireless

Bringing in something that is bound to be a gamechanger if done right, we have HyperX's Cloud Alpha Wireless which boast a battery life of a whopping 300 hours!

HyperX claims that the Cloud Alpha Wireless will have performance just as good as

the Cloud Alpha's wired version even though they have gone for the lighter 50 mm drivers in order to keep the comfort factor alive and on paper, it seems that they have evidently done so. With the Alpha wireless coming in at only 20g heavier than it's wired counterpart, if the battery balance on these is done right, they might just become the best wireless gaming headsets of 2022.

PlayStation VR2

Even though PSVR2 was pretty much expected, having an official announcement always feels great. Although all we got was a specifications sheet and a name, it was still great to have since CES isn't usually home to big console news.

This version of the VR will come with a 4K HDR display along with Head and eye tracking tech meaning you won't have to depend on glowing lights or on your new sense controllers which were also announced this year itself. Apart from that, the PS VR2 also boasts a 2000 x 2040 resolution for each eye and a 110 degree FOV while keeping the original OLED display with the 120 Hz refresh rate. The PS VR2 is expected to release in the year 2023.
