AirTags: BOON OR BANE?

AirTag may be a very helpful innovation, but in the wrong hands, it's a nightmare!

Harshita Arya | feedback@digit.in

Apple's AirTag is a GPS tracking gadget that's intended to function as a key finder, of if you want to attach them to important things, they can help you locate them. People use them to locate personal items such as keys, backpacks, tiny electronic gadgets, automobiles, and many more. Obviously, this is a device built for the western world primarily, because they have the space to lose things in. Most of us

THE GOOD

AirTags are just a tad bigger than the CR2032 batteries they run on – you know, the same CMOS battery that is in our PCs. Apple says each AirTag should run for a year before you need to change a battery. Now if only they could give an iPhone that battery life, we'd all be thrilled!

While we joked about not having the space to lose anything in Indian cities, one of the most important features of AirTags are separation alerts. If you use an iPhone and attached an AirTag to your backpack, you could set your iPhone to alert you when you walk more than a certain distance away from your backpack. Your buzzing phone would ensure you don't jump off a

train or a bus in a hurry and forget your belongings.

While there's no fixed range at which an AirTag works, because different situations have different barriers that can block out Bluetooth signals, we can assume that Bluetooth's maximum range of 100 metres is also AirTag's limit. They're IP67 water and dust resistance, which means it can survive 30 minutes of immersion in water up to one metre (3.3 feet).

One of the biggest advantages of AirTag is that these tags are using the Find My network, which means that all Apple devices report and track them, not just your own. If you are in a large house with a big family, everyone's Apple devices can work together to find those rogue car

can't really misplace a car in our tiny homes, so we suppose these are more first-world problems.

AirTags use Apple's 'Find My' network, and are not satellite navigation devices, but use secure Bluetooth instead. AirTags are compatible with any iPhone, iPad, or iPod Touch that is running iOS 14.5 or later. It has ultra-wideband (UWB) technology, which allows it to more accurately find goods thanks to the inbuilt U1 chip.
