Kingston Fury 5200 MHz DDR5 32 GB (2x 16 GB) RAM Kit

Micron all the way

It has been a few months since Intel's Alder Lake processors were launched and we now have a healthy mix of DDR5 and DDR4 motherboards in the market. Those who want a little extra performance would opt for the newer memory standard, however, there aren't that many DDR5 memory kits to choose from in the market. You can chalk this up to the fact that there's a shortage of DDR5 memory and then there's also the global chip shortage to contend with. Certain brands have gone the extra mile of bringing DDR5 memory to India in ample supply and Kingston is one of them. Here's how their new FURY Beast DDR5 kit fares.

BUILD AND DESIGN

The Kingston FURY Beast DDR5 module has a slightly different heat-sink design than the DDR4 modules under the FURY Beast lineup. The heatsinks are just shy of 35 mm in height making these modules compatible with practically all beefy CPU coolers in the market. The mating mechanism for the two metal halves of the heatsink is the same as what we've seen before.

These modules use Micron chips for the DRAM as Micron seems to have more supply than other DRAM manufacturers at the moment. These are Micron MT60B2G8HB-48B DDR5 SDRAM chips with a density of 16 Gb and they're rated to operate at 4800 MT/s and can be overclocked to hit 5200 MT/s using one of the XMP profiles.

The PMIC on the module is an APW8502C which is the same that we'd seen on the CORSAIR DOMINATOR PLATINUM DDR5 memory

modules. There's still no information about these PMIC chips and the closest we can figure out is that they belong to a family of PMICs that provide '4 buck single phase PWM controllers' which can be used to convert the 5V DC that the memory modules receive from the motherboard to the appropriate voltages required by the DRAM chips.

Then for the folks who're interested in RGB, there's none of that on these modules. Overall, the build quality of the FURY Beast DDR5 modules is at par with the top players in the memory market, so you're in good hands.

PERFORMANCE

With XMP 3.0, the modules run at 4800 MT/s at 38-38-38-70 and with the XMP-5200 profile, this becomes 5200 MT/s at 40-40-40-80. Without XMP, the timings get a little looser and settle at 40-39-39-77. The latency reduction with XMP does bear fruit with certain applications but for most, you might not notice the difference.

At 5200 MT/s, you get 83,058 MB/s for read speeds, 75,144 MB/s for write speeds and 76,502 MB/s for copy speeds. When you switch to the

Price
₹25,407

FEATURES.....	80
PERFORMANCE.....	90
VALUE.....	75
DESIGN.....	80

4800 MT/s profile, this becomes 75,633 MB/s, 69,912 MB/s and 70,944 MB/s. The performance difference in this synthetic benchmark is 7.8 to 9.8 per cent. In real world applications, the impact

of this trickles down to about 1-to-3 per cent.

VERDICT

The Kingston FURY Beast has the same configuration as the other DDR5 kits we've tested so there's little in terms of performance difference. This will continue to be the case until DRAM manufacturers start putting out a larger variety of chips. When it comes down to the price, the FURY Beast is cheaper than the competition and thus, makes it a more appealing buy.

—Mithun Mohandas
