180 million year old fossil found

180-million-year-old fossilised remains of an ichthyosaur known as a 'sea dragon' were found. <https://digit.in/feb22-35>

Getting a budget PC?

Here are your options

E

veryone who wants to build a PC should be able to do so without breaking the bank. Not all PCs are

meant to be gaming PCs and there are a lot of people, institutions and organisations that have the need to build PCs that are aimed at being productivity machines. Machines that will be used to browse the Internet, run Excel sheets and perform simple tasks such as data inputting. Such tasks don't need powerful processors or even a discrete graphics card. A simple Core i3 or Ryzen 3 processor coupled with a basic motherboard and the works.

The reason for picking entry-level hardware for such machines is two-fold. Firstly, the compute power requirements are low, as we've already mentioned. Then there's the fact that the money generated from this work is often low. So not only is there no money to be invested but there's honestly no need to invest large sums into building a powerful system. Think of these as your nearby Mom-and-Pop businesses that are of great help to the local community.

Of late, the number of processors and the accompanying hardware available in the entry-level segment have been getting more and more expensive. It's either that or the

components are getting bundled. The entry-level segment is where flexibility of picking components and upgradability matter the most. If you wish to upgrade your processor, you shouldn't be forced to opt for a 'CPU and motherboard combo' which is way more expensive. So what can you get?

Let's explore the choices that consumers have when trying to build a new PC.

• Buy Individual Components

This is the way DIY PCs have been

• Buy a thin-client system

A thin-client is a pre-built PC which comprises the chassis with the motherboard, processor, RAM, storage and power supply pre-installed. Sometimes, the RAM and storage might not be installed.

• Buy a pre-built desktop

As the name states, a pre-built is basically a complete PC.

• Buy a laptop

Like the previous one, this too is self-explanatory.

The above choices have been listed

built since time immemorial.

• Buy a bare-bones system

Think of this as just the motherboard and power supply installed in a chassis. You get to pick the processor, RAM and storage.

in order of flexibility of upgrading or customising. There's obviously some overlap between some of the choices. Thin client systems are basically barebones systems which have been pre-configured. However, thin-client
