The Heart *of the* Iron Man

This one goes out to all the Tony Stark fanboys out there!

Atreya Raghavan | feedback@digit.in

G

enius, Billionaire, Playboy, Philanthropist. It was perhaps Tony Stark himself who

surmised Tony Stark best.

Throughout the events of the first three Iron Man films, Captain America: Civil War, The Avengers, The Age Ultron, Infinity War and Endgame, as well as Spider-Man: Homecoming, and Spider-Man: Far From Home, we witnessed Stark's character go from a callous, misogynistic, and arrogant businessman to an albeit sometimes sarcastic but loving mentor, father figure, friend and team player, always ready to put the safety of those around him and the earth itself, before his.

Stark, and the Iron Man suit as an extension of himself- beginning from the Mark I to the Mark LXXXV Armor, serve as a source of marvel as well as one of constant inspiration, making him one of the most, if not the most, influential characters in the Marvel Cinematic Universe. However, an often overlooked, extremely crucial part of who Iron Man was, is the Arc Reactor- a device that kept Stark alive for the duration of the first three Iron Man films, as well as powered Stark Industries, the Avengers' Tower, and powered all Iron Man Suits.

And so, here we have for you, all you need to know about this small device capable of producing vast amounts of energy, without which Iron Man as we know it, most likely would not have existed.

Palladium Arc Reactor Mark I:

This was the original miniaturised arc reactor with a palladium core, designed by Stark and Ho Yinsen when the former was being held captive by the Ten Rings in Afghanistan. It was primarily designed to power an electromagnet Stark made to keep

shrapnel from one of Stark's own missiles from entering his heart, and was capable of generating 3 Gigajoules or 300,00,00,000 Watt Seconds of energy, enough to keep Stark's heart beating for up to 50 lifetimes.

Palladium Arc Reactor Mark II:

The Mark II Palladium Arc Reactor was built by Stark once he returned home, to power his electromagnet as well as the Mark II and III Iron Man suits. Obadiah Stane stole the Mark II Palladium Reactor to power the Mark I Iron Man suit which he found
