Amazon Echo Show 10

Amazon's state-of-the-art smart display

The Amazon Echo Show 10 is a unique Alexa-enabled smart speaker + smart display from the company. The Echo Show 10 trumps other smart displays that are usually stationary screens. This one follows the user around using visual and auditory cues which sets it apart from other smart displays, on paper. Wondering how the Amazon Echo Show 10 fares in practice though? Let's find out.

BUILD AND DESIGN

The Echo Show 10 fuses the cylindrical shape of the Amazon Studio or Amazon Echo with the tablet shape of previous-gen Echo Show models. So, it essentially has two separate parts – the speaker system at the bottom and the 10.1-inch display on the top. One of its most unique properties is that the display rotates automatically using visual and audio cues from the user. So, move about in a room when watching a recipe or on a video call, and the screen should follow you around making sure it is always in view for you.

The bottom of the speaker has a brushless motor which allows it to rotate. The speaker portion at the bottom has a grille fabric material that feels pretty premium to the touch. It houses two front-firing 1-inch tweeters that work alongside a 3-inch woofer.

On the front of the display, there's a microphone and a 13-megapixel camera for calls and the auto-rotation technology. The camera quality is pretty decent for a smart display with crisp enough videos captured. The camera also finds use as a home security camera, allowing users to view a live feed from the Alexa app.

The screen has a 1280 x 800 resolution which isn't as crisp as a dedicated tablet but it does the job just fine here. The display is adequately colour accurate as well. As for buttons, they're all present on the top of the screen. There are physical buttons for volume

levels, muting the far-field microphones, and a sliding shutter that covers the camera for privacy.

FEATURES

Let's talk a bit more about the Amazon Echo Show 10's unique party trick – the automatic rotating screen. When testing this feature, we found it to be moderately accurate when there's one person in the room. There's minimal jerking and jitteriness in this case and it doesn't take too long to reposition itself as well. However, as soon as there are more people added to the mix, we found that the display struggles to accurately reposition itself and makes many jerk movements in trying to reposition itself at the right angle.

Now, this is still an Alexa-enabled smart speaker/display, so we tested that as well. The bonus of having a screen is that you get visual cues for your questions/requests alongside Alexa's vocal feedback. You can see the album art of a song, detailed weather information, images related to searches, full-fledged TV shows on Netflix, and much more. Alexa comprehends most of the commands you throw at her easily and now can even respond to commands in Hindi! As for music, you can stream through services such as Hungama Music, Amazon Music, Spotify, Apple Music, and JioSaavn. You can do other

basic things that most Amazon smart speakers allow such as setting alarms and timers, listening to audiobooks on Audible, noting down shopping lists, getting information from the internet, and activating a slew of Alexa skills.

Like the fourth-generation Amazon Echo, the Echo Show 10 also comes with a built-in Zigbee hub for a wide smart home device compatibility. So, you can connect smart devices such as light bulbs, door locks, switches, plugs, refrigerators, and more without the need for a separate hub, app or skill.

AUDIO PERFORMANCE

At its core, the Amazon Echo Show 10 is a smart speaker. Which means, sound is an integral part of the equation. The overall sound signature is warm but the sound may be slightly muffled at lower volumes due to the screen blocking a part of the speaker. At high volumes, the speaker has minimal distortion but does sound slightly tinny or shrill. The device fills up a medium-sized room with sound easily but the sound isn't as enveloping as the Google Nest Audio or even Amazon's own Echo Studio.

VERDICT

At a premium price tag of ₹24,999, you get a similarly premium feature on the Amazon Echo Show 10 – motion tracking. Integrating this feature into an already smart display bumps up its efficiency by quite a bit. If music is your primary concern though, you'd be better off considering the Amazon Echo Studio or Google Nest Audio instead.
