

Xiaomi India with MIUI13

Xiaomi India will bring MIUI 13 to 10 devices in Q1 2022 with optimised file storage and efficiency. <https://digit.in/mar22-11>

Doctor Strange 2 multiverse

Doctor Strange 2 rumor teases crazy multiverse cameos like X-Men, and an alternate version of Iron Man. <https://digit.in/mar22-12x>

the arrival of Tap to Transfer which would allow you to switch playback or move audio files between any compatible device just by bringing the phone or tablet you are using the app on, closer. Of course, we have seen something similar on iOS and we know it works flawlessly across all Apple devices and their HomePods so we're naturally curious to see how this feature is brought to life in the Android ecosystem.

According to 9to5Google, they haven't been able to test out this feature yet but they are speculating this feature will make use of the NFC technology to communicate with the smart devices similar to what Apple does using UWB tech. An interesting fact to note here would be that neither the Nest Audio, nor the Nest Mini, Google's current generation home speakers, support the aforemen-

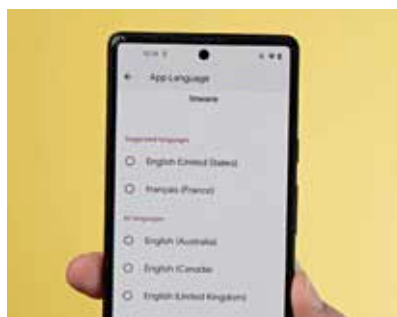

tioned technologies so we might be completely off track here and Google might've just relied on Bluetooth or Wi-Fi Direct to actually do so.

APP BY APP LANGUAGE SELECTION

As we mentioned in the Intro itself, Android 13 will provide you the luxury to actually choose what language you would want to use in each app that is on your phone. Of course, We assume that you could simply select a default language and you would get to change the language in whatever app you'd want by tweaking some stuff in your system settings as usual.

Obviously, this feature was made for people who know more than one language and would prefer to be

using different apps in different dialects such as you might want to use YouTube in English and Facebook in Hindi. Now, that is easily possible instead of you having to use one of those in a Chrome tab and using Google Translate to use them in your preferred language.

RUNNING VIRTUAL MACHINES

Yes, you read that right, you can actually run virtual machines on Android 13. Such a feat was accomplished by My. Danny Lin who posted his experiment online. Mr. Lin could only achieve this feat because of Android 13's better handling of virtualization. You see, the latest version supports a common hypervisor in the form of a KVM, i.e. a kernel-based virtual machine.

So basically what we're trying to say here is, you'd get better results and more consistent experiences while trying to run Windows or Linux or basically any virtual machine on an Android 13 device. And guess what, in true gamer

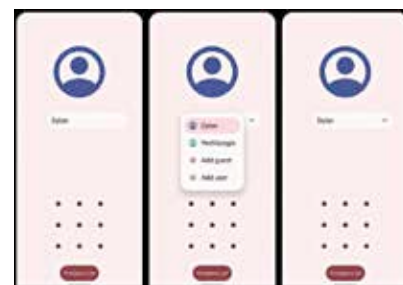

fashion, Danny went out of his way and ran "Doom" on his Google Pixel 6 using the Windows 11 VM he had set up using the aforementioned features on Android 13.

LOCKSCREEN PROFILE SWITCHER

Android 13 will bring in a few changes to make the multiple user experience (which has not been explored too much) on Android based devices better.

On Android 13, when you would be on the lockscreen, you'd see a picture (if assigned) along with a name, if you were to tap on the name, you would get to see all the other profiles on the device in a drop down menu. After choosing which user would be using the device, the phone/tablet would make its changes accordingly. This Profile system would be familiar to anyone who uses Windows .

Although this seems pretty self explanatory, let us look at what exactly this feature might be used for and by whom.

First off, Parents. With what we've seen during the pandemic, there were tons of parents who had to lend their own personal devices to their children for them to pursue their education because, well, handing a child their own phone at the age of 4 isn't exactly a bright idea.

Next, it could be for someone who wishes to maintain different profiles for their work life and their personal life on the same device.

Or of course, this could just be a feature focussed more towards tablets as they are one of the most shared devices in an average household.

The new Lock-screen profile switcher would also make it a more prominent feature as currently, you only get to see a small icon on the top corner of the display without any obvious indication that the profiles can be switched. [1](#)
