GAMIFICATION: THE NEW GEN EDUCATION?

It's time to make the learning process more fun

Nayan Panda | feedback@digit.in

H

ow many times have you had this strange experience, where a concept taught inside a video game brings

more sense and alacrity, than a classroom lecture ever did? And if you can relate to this, you are not the one to blame. Infact, it just goes on to assert how even the same lessons, depending

on their demonstration and implementation, can be either ardent or downright... boring.

But how does this work? Can all of these so-called "boring" topics be straight up gamified and made simple? Where do we draw a line to this practice? Is this the much needed new-gen revolution to the existing education system? And, most importantly, is this really an ideal solution? Let's plunge into the depths of this concept and discover more about this practice.

THE IDEA

Going by definition, gamification is the process of having pieces that make up games, making them interesting for players, and then applying those

same elements to influence behaviour in non-gaming contexts. Gamification, in other words, is the addition of game features to a normally non-game environment. Meanwhile, gamification of learning is an educational strategy that uses video game inspired design and elements in a learning environment to inspire students while superlating their enjoyment and engagement. The aim here is to captivate their attention and make complex stuff compelling/fun to learn, while motivating them to continue learning. Game-based learning is another active learning strategy in which games are utilised to help students learn more effectively. Learning occurs as a result of playing the game, which encourages critical
