thinking and problem-solving abilities. Game-based learning can be done with digital or non-digital games, and it can also involve simulations that allow students to get a personal experience with the content. It should come as no surprise that learning is best while enjoying it and thus, gamified or game based topics and lessons often yield better results than the conventional way of teaching.

HOW DO WE GAMIFY THINGS?

As with most teaching methods, gamifying stuff can come in steps too. These are namely:

1. Assessing the hard-to-get points and problems in the given topic, and identifying the environment while acknowledging the interest of the learners.
2. Introducing structure into the concept by setting up goals or checkpoints.
3. Defining progress by using game-like systems of "levels", "scores" or "stages".
4. Organising interactive activities and encouraging the formation of teams to tackle problems.
5. Reflecting the progress using trackers such as leaderboards, level and high scores, alongside introducing rewards into play for achievements of desirable outcomes.

THE BENEFITS

Games naturally intrigue a student's mind and give the idea of 'learning-together' a much needed brush up. Even if unintentionally, introducing competitiveness in academics often leads to conflict, pressure and disunity amongst students as they end up squashing each other, in an attempt to climb that grade ladder. Gamified subjects can change this to a healthy competition by introducing playful barriers instead. Such barriers can be behavioural, social, private, logistical or even creative. This also induces a relaxed atmosphere in regards to failure which ensures that the learners wouldn't be afraid to try their hands on the problem again, uncovering an

intrinsic motivation for learning. Being more proactive and open to making mistakes also invites the opportunity to think outside of the box. Besides that, morphing activities into games, makes comparing and reflecting on personalised performance a whole lot easier. Using game mechanics inspired roadmaps, like checkpoints and levels, and reward systems also promise sustained contribution from the students. The content meant to be taught is also delivered much more efficiently for students who find processing information from textbooks and excerpts tedious. The process is also very tangible and rewarding students for achieving small milestones helps retain their attention on the subject. These rewards can be as naive as an excuse

assuage elementary basics of a topic, it can soon become pretty challenging to sustain in the longer run. Also, the more creative investment the topic calls for, the harder it gets to scale its activities. Gamification is exceptionally good to break down complex or dull topics but it equally calls for greater efforts and creative investments from the teacher. Not everyone would be willing to sacrifice an established bubble of instruction to try and adopt this new creative approach to the same problem. With the intended creative approach, it becomes a pretty procrustean task to keep up with innovative ideas which in turn will incite enough interest. Thus, the practice is not very scalable and far from being an ideal solution. What can instead be done is

inculcating certain gamified practices selectively for the vexed problems in a classroom.

WRAP-UP

Gamification has been found to be extremely beneficial in a variety of situations, including educational settings, e-learning environments, and even corporate training. It works

from a day's homework but still give a sense of validation and achievement. Gamifying subjects can be fairly simple too by identifying the behaviour you wish to encourage in a student, and rewarding them for achieving the same. The idea here is to give the students a sense of ownership over their learning and making the whole experience simply... fun.

THE RESTRICTIONS

Given the social connections, immediate feedback system and assimilating learning process, what makes most of today's smart learning still inspired by archaic methods instead? It is so because, while gamification and gamified topics might be ideal to

because it elicits genuine, strong human emotions like joy, intrigue, excitement, and accomplishment while making use of existing and limited technologies. Gamification is being used by many organisations, institutions, and brands all around the world, with remarkable outcomes. There is plenty of potential for experimentation when it comes to what you gamify and it helps bring engagement and motivation to the field more often than not. Even if the students aren't interested in gamified classes they might take interest in gamified projects which enhances the lesson plans. Gamifying most topics can be fairly simple too, making it a considerable update in an existing curriculum to yield exceptional results. **d**
